Silica is a naturally occurring mineral found in all parts of the globe.

Silica is found in rock, soil and sand:
- Silica is composed of the elements Silicon + Oxygen = SiO₂

Silica is the hazardous type for construction workers. The most common form is quartz.

Performing tasks such as—cutting, drilling, coring, grinding, sanding, sandblasting, pulverizing, dry mixing, cleaning up—with these materials may create airborne silica dust that can harm your health.

These materials may contain silica:
- Asphalt
- Brick
- Cement
- Concrete
- Concrete block
- Drywall
- Ceramic products (siding, cladding panels)
- Grout
- Gunite/Shotcrete
- Mortar
- Paints
- Plaster
- Refractory Mortar/Castables
- Refractory units
- Rock
- Roof tile (concrete)
- Sand
- Soil (fill dirt, top soil, soil w/fly ash added)
- Stone (granite, limestone, quartzite, sandstone, shale, slate, cultured, etc.)
- Stucco/EIFS
- Terrazzo
- Tile (clay and ceramic)

This material was produced under grant SH29642SH6 from the Occupational Safety and Health Administration, U.S. Department of Labor. It does not necessarily reflect the views or policies of the U.S. Department of Labor, nor does mention of trade names, commercial products, or organizations imply endorsement by the U.S. Government.
