DEPARTMENT OF LABOR

Occupational Safety and Health Administration

29 CFR Part 1910

[Docket No. S-760A]

Hazardous Waste Operations and Emergency Response

AGENCY: Occupational Safety and Health Administration; Labor.

ACTION: Notice of proposed rulemaking and public hearings.

SUMMARY: The Occupational Safety and Health Administration (OSHA) is proposing to amend the OSHA standards for hazardous waste operations and emergency response in 29 CFR 1910.120. OSHA proposes a permanent final standard to replace the interim final rule required by Congress in the Superfund Amendments and Reauthorization Act of 1986 (SARA) (Pub. L. 99-499). The interim final rule was published in the Federal Register on December 19, 1986 (51 FR 45554).

Employees involved in operations covered by the Comprehensive Environmental Response, Compensation and Liability Act of 1980 as amended (CERCLA or "Superfund") [42 U.S.C. 9601 et seq.], in certain hazardous waste operations conducted under the Resource Conservation and Recovery Act of 1976 as amended (RCRA) [42 U.S.C. 6901 et seq.], and in any emergency response to incidents involving hazardous substances would be covered by this proposed rule.

The issuance of this proposed rule is mandated by section 120(b) of SARA. The proposed rule will regulate employee safety and health at hazardous waste operations and during emergency response to hazardous substance incidents.

Informal public hearings on the subject of this rulemaking are scheduled to afford interested parties with the opportunity to comment on OSHA's proposed rule.

2. The informal public hearings will be held at the following locations:
   a. Washington, DC—Frances Perkins Department of Labor Building Auditorium, 200 Constitution Avenue NW., Washington, DC 20210,
   b. San Francisco, CA—Ramada Renaissance Hotel, 55 Cyril Magnin St. (Market at 5th Street), San Francisco, CA 94102, 415-392-6000.

3. Notices of intention to appear and documentary evidence which will be introduced into the informal public hearing record must be sent in quadruplicate to Mr. Thomas Hall, U.S. Department of Labor, Occupational Safety and Health Administration, Division of Consumer Affairs, Room N—3649, 200 Constitution Avenue NW., Washington, DC 20210.

FOR FURTHER INFORMATION CONTACT:

Proposed Rule: Mr. James F. Foster, U.S. Department of Labor, Occupational Safety and Health Administration, Division of Consumer Affairs, Room N—3647, 200 Constitution Avenue NW., Washington, DC 20210, 202-523-6151.

Public Hearing: Mr. Thomas Hall, U.S. Department of Labor, Occupational Safety and Health Administration, Division of Consumer Affairs, Room N—3647, 200 Constitution Avenue NW., Washington, DC 20210, 202-523-6151.

SUPPLEMENTARY INFORMATION:

I. Background

The U.S. Environmental Protection Agency estimates that approximately 57 million metric tons of hazardous waste are produced each year in the United States. These wastes must be treated and stored or disposed in a manner that protects the environment from the adverse affects of the various constituents of those wastes.

In response to the need to protect the environment from the improper disposal of these hazardous wastes, Congress, over the years, has enacted several pieces of legislation intended to control the nation's hazardous waste problem. Federal laws passed in 1965 and 1970 initially addressed solid waste disposal. Several other pieces of legislation have been enacted by Congress that have ultimately led to the development of this proposed rule and they are discussed below.

A. The Resource Conservation and Recovery Act of 1976

The first comprehensive, federal effort to deal with the solid waste problem in general, and hazardous waste specifically, came with the passage of the Resource Conservation and Recovery Act of 1976 (RCRA). The act provides for the development of federal and state programs for otherwise unregulated land disposal of waste materials and for the development of resource recovery programs. It regulates anyone engaged in the creation, transportation, and disposal of "hazardous wastes." It also regulates facilities for the disposal of all solid wastes and prohibits the use of open dumps for solid wastes in favor of requiring sanitary landfills.

There are however many hazardous waste disposal sites that were created prior to the passage of RCRA. These sites are often abandoned and contain unknown quantities of unknown wastes.

In response to the need to clean-up and properly reclaim these pre-RCRA sites Congress enacted the Comprehensive, Environmental Response, Compensation and Liability Act of 1980 (CERCLA) commonly known as "Superfund." Superfund established two related funds to be used for the immediate removal of hazardous substances released into the environment. Superfund is intended to establish a mechanism of response for the immediate clean-up of hazardous waste contamination from accidental

spills and from chronic environmental damage such as is associated with abandoned hazardous waste disposal sites.

The treatment and disposal of hazardous wastes under RCRA and CERCLA create a significant risk to the safety and health of employees who work in treatment and disposal operations. Exposure to hazardous wastes through skin contact, skin absorption and inhalation pose the most significant risks to employees. Employee exposure to these risks occurs when employees respond to hazardous waste emergencies, when they work with hazardous wastes during storage, treatment and disposal operations or when they participate in the clean-up of abandoned waste sites.

This risk of exposure and the need for protecting employees exposed to hazardous wastes is addressed in the “Superfund Amendments and Reauthorization Act of 1986” (SARA).

C. Superfund Amendments and Reauthorization Act of 1986

On October 17, 1986, the President signed into law the “Superfund Amendments and Reauthorization Act of 1986” (SARA). As part of SARA, in §126 of Title I, Congress addressed the risk of injury to employees by providing that the Secretary ("Secretary") issue interim final worker protection regulations within 60 days after the date of enactment of SARA that would provide no less protection for workers engaged in hazardous waste operations than the protections contained in the U.S. Environmental Protection Agency's (EPA) “Health and Safety Requirements for Employees Engaged in Field Activities” manual (EPA Order 1440.2) dated 1981, and the existing OSHA standards under Subpart C of 29 CFR Part 1926. OSHA published those interim final regulations in the Federal Register on December 19, 1986 (51 FR 45654). A correction notice was published on May 4, 1987 (52 FR 16241). With the exception of a few provisions that had delayed start-up dates, OSHA's interim final regulations became effective on December 19, 1986 in accordance with section 126(c), and apply to all regulated workplaces until the final rule developed under sections 126(a)-(d) and proposed today becomes effective.

Section 126(a) of SARA provides that the Secretary shall “…pursuant to section 6 of the Occupational Safety and Health Act of 1970, promulgate standards for the health and safety of employees engaged in hazardous waste operations.” These standards must be promulgated within one year after the date of enactment of SARA. This notice initiates the development of those standards by issuing proposed regulations as indicated in section 128(b) of SARA. SARA further provides in section 126(b), that the proposed regulations address, as a minimum, certain worker protection provisions. These are: site analysis, training, medical surveillance, personal protective equipment, engineering controls, material exposure limits, informational programs, materials handling, new technology programs, decontamination procedures, and emergency response. While some of these worker protection provisions were addressed in the interim final rule, this proposed rule will address, as a minimum, all provisions under section 126(b) of SARA.

Pursuant to section 126(c) of SARA, the final regulations promulgated under section 126(a) are to take effect one year after the date they are promulgated. Section 126(c) also provides that the final regulations are to include each of the worker protection provisions listed in section 126(b) unless the Secretary determines that the evidence in the public record developed during this rulemaking and considered as a whole does not support inclusion of any such provision.

This proposed rule has been adapted from the language of the interim final rule. Changes have been made to address more fully the provisions which Congress had directed the Agency to cover in the proposal. OSHA utilized the language from the EPA manual entitled “Health and Safety Requirements for Employees Engaged in Field Activities” (1981) and the language of OSHA's safety and health standards in Subpart C of 29 CFR Part 1926 to develop the interim final rule, and much of that same language is also used in this proposal. The interim final rule also contains language taken from various documents issued either jointly or by the EPA. OSHA, the U.S. Coast Guard, and the National Institute for Occupational Safety and Health (NIOSH), and that language has also been used in preparing this proposed rule.

OSHA has specifically used the joint OSHA/EPA/USCG/NIOSH manual entitled, "Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities" (Preamble Reference 6), as an outline in preparing the interim rule and this proposal. This manual was developed as a result of the collaborative efforts of professionals representing the four agencies. These professionals, who are knowledgeable in hazardous waste operations, worked with over 100 experts and organizations in the development of the criteria contained in this manual. The manual was published in October 1985 and is public information. The manual is a guidance document for managers and contractors who are responsible for occupational safety and health programs at active hazardous waste sites. The manual is intended for use by government officials at all levels and contractors involved in hazardous waste operations. The manual provides general guidance and is intended to be used as a preliminary basis for developing a specific health and safety program for hazardous waste operations. Further, the major subject areas listed in section 126(b) of SARA are nearly identical to the major chapters in the manual. The language of the proposed rule also clarifies some confusion in the interim rule that OSHA has identified since the promulgation of the interim final rule.

II. Summary and Explanation of the Standard

Paragraph (a) -- Scope, application, and definitions

In paragraph (a)(1), Scope, OSHA proposes to use the scope of the interim final rule for Hazardous Waste Operations and Emergency Response as published in the Federal Register on December 19, 1986 (51 FR 45654) with some modification. The scope of the interim rule included the following:

(iv) Hazardous substance response operations under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 as amended (CERCLA), including initial investigations at CERCLA sites before the presence or absence of hazardous substances has been ascertained;

(vi) Major corrective actions taken in clean-up operations under the Resource Conservation and Recovery Act of 1976 as amended (RCRA);

(vii) Operations involving hazardous waste storage, disposal and treatment facilities regulated under 40 CFR Parts 264 and 265 pursuant to RCRA, except for small quantity generators and those employers with less than 90 days accumulation of hazardous wastes as defined in 40 CFR 262.84;

(viii) Hazardous waste operations sites that have been designated for clean-up by state or local governmental authorities; and

(v) Emergency response operations for releases or substantial threats of releases of hazardous substances, and post-emergency response operations to such releases at all workplaces including those not defined in paragraphs (a)(1)(i) through (a)(1)(iv).

OSHA is proposing to modify paragraph (a)(1) of the interim rule by
moving the exception in paragraph (a)(1)(iii) to paragraph (a)(2)(iii) and by editorially revising the structure and text of the language of the interim rule without changing the scope in the proposal. The modifications to the text are to organize the various subparagraphs on scope into proper groups of coverage.

To further clarify scope, non-emergency response coverage has been left in paragraph (a)(1) and emergency response coverage has been given its own paragraph in (a)(2). The scope for emergency response has been clarified as well. The change makes clear that it is employers whose employees have a "reasonable possibility" of engaging in emergency response operations that are covered. Employers whose employees would not have such a reasonable possibility are not covered.

Who is Covered?

The scope of this rulemaking has been a major issue during the development and promulgation of the interim final rule and this proposal. OSHA is requesting specific comment on whether our interpretation of scope is too broad or too narrow.

The proposed standard would cover the same three basic areas covered by the interim final rule.

I. CERCLA Facilities

For the purposes of this proposal, CERCLA sites include hazardous substance response operations at sites regulated under 40 CFR 300, Subpart F, RCRA closure activities conducted under 40 CFR 285, Subpart G, those sites similar to CERCLA sites that have been designated for clean-up by State or local governments.

II. RCRA Facilities

OSHA would also continue to regulate RCRA treatment, storage and disposal (T/S/D) facilities. T/S/D facilities range from the typical generator with a hazardous waste storage area to the large, complex hazardous waste dump. EPA estimates that approximately 80 percent of all generators also treat, store, or dispose of their hazardous wastes and thereby qualify as a T/S/D facility. Over 30,000 T/S/D facilities notified EPA in 1980 that they would qualify for regulation under section 3004 of RCRA.

The term "T/S/D" is commonly used to refer to the three different hazardous waste management activities that are regulated under RCRA section 3004, and which thus require a permit under RCRA section 3005. For the purposes of this rule treatment, storage, and disposal facilities are defined as follows:8

1. A "T/S/D" facility involves any place of employment where any method, technique, or process, including neutralization, designed to change the physical, chemical, or biological characteristics or composition of any hazardous waste so as to recover energy or material resources from the waste, or so as to render such waste non-hazardous, or less hazardous; safer to transport, store or dispose of; or amenable for recovery, amenable for storage, or reduce in volume.7

2. The term "storage facility" refers to any place of employment used to hold hazardous waste for a temporary period, at the end of which the hazardous waste is treated, disposed of, or stored elsewhere.6

3. The term "disposal facility" refers to any place of employment used for the discharge, deposit, injection, dumping, spilling, leaking, or placing of any solid waste or hazardous waste into or on any land or water so that such solid waste or hazardous waste or any constituent thereof may enter the environment or be emitted into the air or discharge into any water, including ground waters.9

4. The following T/S/D facilities would not be covered by this rulemaking:
   1. Facilities that dispose of hazardous waste by means of ocean disposal pursuant to a permit issued under the Safe Drinking Water Act underground injection control program.
   2. The disposal of hazardous waste by underground injection pursuant to a permit issued under the Safe Drinking Water Act underground injection control program.
   3. A publicly owned treatment work (POTW) which treats or stores hazardous wastes which are delivered to the POTW by a transport vehicle or vessel or through a pipe.
   4. T/S/D facilities which operate under a state hazardous waste program authorized pursuant to RCRA section 3006.
   5. Facilities authorized by a state to manage hazardous or non-hazardous waste, if the only hazardous waste handled by such a facility is otherwise excluded from regulation pursuant to the special requirements for small generators (See 40 CFR 261.5).
   6. A facility which treats or stores hazardous wastes that are subject to the special requirements for hazardous wastes which are used, reused, recycled or reclaimed. Note, however, that as provided by 40 CFR 261.8(b), a facility must obtain a permit as a storage facility if it stores "listed" hazardous wastes, mixtures including a "listed" hazardous waste, or sludges, prior to use, reuse, recycling, or reclamation.
   7. The accumulation of hazardous waste by generators for 90 days or less.
   9. Owners or operators of a "totally enclosed treatment facility." A totally enclosed treatment facility is one where the treatment of hazardous waste which is directly connected to an industrial production process which is conducted and operated in a manner which prevents the release of any hazardous waste or any constituent thereof into the environment during treatment. An example is a pipe in which waste acid is neutralized.
   10. Owners and operators of elementary neutralization units and waste-water treatment units.
   11. Persons taking immediate action to treat and contain spills. Note that after immediate response activities are completed, any hazardous waste spill residue or debris is subject to full regulation.
   12. Transporters storing manifested wastes in approved containers at a transfer facility for 10 days or less.
   13. The acts of adding absorbent material to hazardous waste in a container and adding hazardous waste to absorbent material in a container, if the materials are added when wastes are first placed in the container.10

III. Emergency Response

This proposal would also continue to cover emergency response to releases of hazardous substances at all sites including non-CERCLA and non-RCRA sites.

OSHA believes that Congress intended the proposed rule to have such coverage. This is indicated by the language of SARA as well as the legislative history.

The language of section 126(a) mandates safety and health standards for the protection of employees engaged in hazardous waste operations. The term "hazardous waste operation" is not limited in the legislation and a response to spills of hazardous substance on the highway or from a railway tank car in order to control and contain the hazardous substance (which has become a waste once it is not contained) is in the common sense meaning a hazardous waste operation.

This interpretation is reinforced by the fact that SARA is a free-standing
statutory provision and not an amendment to CERCLA. The clear Congressional intent then is to provide protection to employees whenever they deal with hazardous wastes.

In addition, Section 126(d)(4) discussing training for emergency response personnel utilizes the very broad term "hazardous emergency situation." Section 126(g)(1) indicates that training grants may be given independently for emergency response training separate from hazardous waste removal operations. For those and other reasons OSHA believes section 126 is intended to cover emergency response to hazardous substances whether on a CERCLA or RCRA site or elsewhere. However, the clarified language in the scope sections makes it clear the only employers whose employees have the reasonable possibility of engaging in emergency response are covered.

Emergency response employees who respond or will respond to incidents involving hazardous substances are covered by this proposed rule to the extent that they are exposed to hazardous substances. State and local government employees in states that have agreements with OSHA under section 18 of the OSH Act must be regulated by state regulations at least as effective as these to protect public employees. Those state regulations must be issued within six months of the date of promulgation of any final rule, resulting from this rulemaking.

Municipal or other sanitary landfills that handle domestic wastes would not normally be regulated by this proposed rulemaking. Similarly, waste paper recycling plants would not normally be regulated because of the type of wastes they handle. However, both types of operations could be regulated if they have clean-ups for or handle hazardous wastes meeting the scope provisions of the standard.

Also, employees at hazardous waste sites who will not be exposed to, or do not have the potential to be exposed to, hazardous substances are not covered by this proposal. The provisions of these regulations are designed to protect employees who have exposures, and would not be needed for those employees who do not.

Operations with no exposure to hazardous substances, i.e., road building for site action or construction of the setting up of temporary facilities in the clean zone, or the closure of a RCRA site involving the building of a clay cap over hazard wastes, are considered to be construction activities covered by the standards in 29 CFR Part 1926.

The scope and application provisions carry out the intent of Congress and are consistent with good occupational safety and health policy. Employees performing clean-up operations under CERCLA, RCRA (corrective actions) and state or local government designated sites—generally those employees likely to have the highest exposures to hazardous substances over a longer period—would be covered by virtually all the provisions of this proposal. Employees exposed to hazardous wastes in routine RCRA hazardous waste operations, who are regularly exposed to hazardous wastes but in a more controlled environment, would be covered by the more limited requirements of paragraphs (l) and (o) of this proposal. Emergency response workers, exposed usually for short periods to often unknown but possibly high levels of hazardous substances, would have the specific provisions of paragraph (l) directed towards this situation.

How Are They Covered?

In paragraph (a)(3), Application, OSHA proposes to designate the specific requirements of the proposal which apply or do not apply to the work activities covered by the proposed rule. In paragraph (a)(3)(i) the employer would have to comply with the standards in 29 CFR Parts 1910 and 1926, as well as with the requirements specifically covered in this proposed rule. If there is a conflict or overlap, the more protective provisions would apply. Since this proposed rule does not cover all of the hazards present at hazardous waste operations, other OSHA standards in Parts 1910 and 1926 would apply. Other OSHA standards regulate many other hazards, and OSHA wants to make clear that the other standards continue to apply. Also, hazardous waste operators who are not within the proposed scope of this standard would continue to be regulated by the Parts 1910 and 1926 standards.

In paragraph (a)(3)(ii) OSHA proposes that all paragraphs of this section except paragraph (o) would apply to hazardous waste operations at CERCLA sites, at major corrective action at RCRA sites, and at sites designated for clean-up by state and local governments. This part of the proposal has been taken directly from the interim final rule.

In paragraph (a)(3)(iii) OSHA proposes that the requirements set forth in paragraph (o) of this section would specifically apply only to the hazardous waste operations at RCRA sites which are involved in treatment, storage, disposal and handling of hazardous waste. The proposed limited exclusion of small quantity generators and less than 90-day accumulators would exclude from these regulations certain operations such as dry cleaners and gas stations, which come within the purview of RCRA, but are not hazardous waste operators in the normal meaning of the term. The exclusion would depend upon the employer's decision to provide or not provide emergency response by employees to releases of, or substantial threats of releases of, hazardous substance.

OSHA proposes to exempt totally small quantity generators and less than 90 day accumulators from the rule if they do not provide emergency response by their employees to releases of, or substantial threats of releases of, hazardous substances. OSHA further proposes to exempt small quantity generators and less than 90 day accumulators from all parts of the rule except paragraph (l) when they do provide emergency response by their employees to releases of, or substantial threats of releases of, hazardous substances.

OSHA recognizes that many small quantity generators and less than 90 day accumulators consist of smaller businesses with limited employee populations (less than 10 employees). Since most of these establishments rely on the emergency response services of local fire and rescue departments, OSHA is providing relief from these proposed standards when the employer can show that employees will not be exposed to hazardous substances as a result of providing employee emergency response. In cases where such establishments do provide employee emergency response, and thereby expose employees to hazardous substances, OSHA is proposing that such employers meet the emergency response requirements of paragraph (l) of this proposed rule.

Without these exemptions, these proposed regulations could be interpreted to cover gas stations, dry cleaners, and other small businesses which temporarily store small quantities of a hazardous waste. These businesses are not engaged in hazardous waste operations as that term is conceived of normally. In addition, it is not believed that Congress intended such businesses to be covered. They do not present the relatively high exposure to a number of hazardous health risks to employees that hazardous waste sites typically do.

The approximately 4,000 RCRA sites where reasonably large quantities of hazardous wastes are regularly handled,
treated and stored would be covered by the proposed rule. This reflects the legislative intent, meets the normal meaning of hazardous waste operations and preserves the type of safety and health hazards that this regulation is designed to control. This limited exclusion reflects an exemption previously contained in paragraph (a)(3)(iii) of the interim final rule.

In paragraph (a)(3)(iv) OSHA proposes that the requirements set forth in paragraph (l) of this section would specifically apply to the work conducted by emergency response personnel when they respond to hazardous substance emergency incidents. Emergency response personnel include non-employees (i.e., firefighters, EMS personnel, and police) as well as employees.

OSHA requests comment on its approach to coverage and its determination of which provisions apply to various types of operations. It also requests comment on whether other operations should be and are intended to be covered by Congress, and whether specific operations should be excluded because of low exposures.

In paragraph (a)(4), Definitions, OSHA proposes to define various terms used in this rulemaking. The definitions for hazardous substances and hazardous wastes have been taken from the U.S. Environmental Protection Agency (EPA) and U.S. Department of Transportation (DOT) regulations and include those used in the interim rule. OSHA is proposing to modify some of the definitions used in the interim rule where some confusion occurred over the meaning of some of the definitions used in the interim rule. For example, the definition "emergency responder" has been modified to indicate more clearly the type of response that OSHA will be regulating. The definition used in the interim rule implied to many readers of that rule that any response to incidental spills would be considered emergency response. The agency did not intend to regulate employee response to incidental spills that could be cleaned-up or stabilized by the employees in the immediate spill area without the need of coordinated spill-control response from throughout the workplace. Further, the agency did not want to cover releases of hazardous substances that did not expose employees to exposures of hazardous substances above the established permissible exposure limits of this rule.

The term "established exposure levels" is defined to indicate the levels which, if exceeded for 30 or more days per year, trigger medical surveillance of the exposed employees. The term includes not only OSHA established PELs, but also exposure limits suggested by NIOSH and ACGIH. OSHA feels that it is appropriate to go beyond the OSHA established PELs in triggering medical surveillance because of the broadly-worded language in section 126(b)(3), which requires medical surveillance for workers engaged in hazardous waste operations "which would expose them to toxic substances."

The term "permissible exposure limits" is defined as the inhalation or dermal permissible exposure limit specified in 29 CFR Part 1910, Subpart Z. These limits indicate the exposure levels to be achieved by the hierarchy of controls listed in paragraph (g)(1)(i). Employers must set appropriate exposure levels to determine PPE use for substances listed by ACGIH and NIOSH taking into account the levels recommended by those organizations. The definition has been changed from the interim rule. Limits not set by OSHA, NIOSH and ACGIH have been excluded. They would not be generally known and would not have the sanction of an official organization.

OSHA is also incorporating definition for "qualified individual, person who has qualifications by training and experience for the task(s) for which the individual is responsible. That definition is rather general, but detailed requirement for each task would lead to a lengthy and inflexible regulation. The use of other agency definitions has been proposed to assure consistency and compatibility between this proposed rule and the rules and regulations of the EPA and DOT. The remaining definitions have been taken for the most part from SARA, the four agency manual (Reference 6) or existing OSHA standards.

OSHA requests comment on whether its definitions of hazardous waste, health hazard and hazardous substance are consistent with EPA and DOT practice. OSHA requests comment on whether the term "established permissible exposure limit" achieves its goals.

Paragraph (b)—General Requirements

In paragraph (b)(1)(i) OSHA is proposing to require employers to develop and implement a safety and health program for employees involved in hazardous waste operations. The proposed rule makes it clear that the program is to be in writing. That was implicit in the interim rule. The program needs to be in writing so that employers and employees know clearly what to do to handle hazardous substances. If it were not in writing uncertainty could lead to injury and overexposures. Such programs are part of the requirements mandated in section 126(b)(7) of SARA. Subpart C of 29 CFR Part 1926 requires such a program in §1926.60(b), and EPA Order 1440.2, on page 5, further requires training in "safety plan development. OSHA experience also establishes that safety and health program is necessary to protect employees so that hazards are assessed and control programs are systematically laid out. OSHA section 6(b) health standards require compliance plan to set forth health program to protect employees from regulated hazards.

The proposed employer's safety and health program would have to provide for an organizational structure, comprehensive workplan, and site-specific safety and health plan as proposed in paragraph (b)(1)(i) through (b)(1)(iv). The site-specific safety and health plan would have to address the anticipated safety and health hazards of each work operation or activity, and the means to eliminate the hazards or to effectively control them to prevent injury or illness. The site-specific safety and health plan is necessary to help protect employees from exposure to hazardous waste operation which need to be determined and addressed prior to the exposure of employees. The proposed plan provides that this will be done in a systematic manner so that hazards will not be missed, and so that needed protective action will not be overlooked. The approach used has been adapted from reference 6.

The general requirements found in paragraph (b)(2) through (b)(13) of the interim final rule would be eliminated by this proposal. Those paragraphs of the interim final rule merely directed the reader to the appropriate paragraphs of the interim final rule for the specific regulations on a topic. The paragraphs of the interim final rule served only as an index for the interim final rule and OSHA does not believe such an index is necessary for this proposal. The duty requirement for compliance with specific requirements is implicit in the paragraphs addressing specific hazard.

Paragraph (b)(2) would require that site excavations be shored or sloped as appropriate and the employers comply with Subpart P of 29 CFR Part 1926 for site excavations created during initial site preparation or during hazardous waste operations. The language of (b)(2)
is the same as paragraph (b)(14) of the interim rule. OSHA considers that those provisions already apply, but they are specifically cross referenced because they are particularly important since significant excavation activity often occurs on hazardous waste sites.

Paragraph (b)(3) would require employers to notify contractors and subcontractors of the hazards identified by the employer at hazardous waste operations. The language of (b)(3) is the same as paragraph (b)(15) of the interim rule. Sections 126(b)(2) and 126(e) of SARA indicate Congress’s specific interest in protecting employees of contractors, and in involving contractors in the safe operation of hazardous waste sites. This provision would assist the contractor in becoming aware of the operational risks so that the contractor’s employees may be better protected.

Paragraph (c)—Site Characterization and Analysis

The employer needs to know the hazards faced by employees in order to develop and implement effective control measures. Site characterization provides the information needed to identify site hazards and to select employee protection methods. The more accurate, detailed, and comprehensive the information available about a site, the more the protective measures can be tailored to the actual hazards that the employees may encounter. Congress clearly intended that such a requirement be included. Section 126(b)(1) of SARA provides that the proposal include “requirements for a formal hazard analysis of the site...”. Therefore, OSHA is proposing to use the language from the interim rule as the language for the proposed paragraph (c).

It is important to recognize that site characterization is a continuous process. At each phase of site characterization, information is obtained and evaluated to define the potential hazards of the site. This assessment is to be used to develop a safety and health plan for the next phase of work. In addition to the formal information gathering that takes place during the phases of site characterization described above, all site personnel should be constantly alert for new information about site conditions.

Paragraph (d)—Site Control

This paragraph would require the employer to develop a site control program, as part of the employer’s site safety and health plan, to minimize potential contamination of employees. This program would be a part of the safety and health program required by paragraph (b). Several items, such as establishing work zones, need to be considered so that employees know the hazards in different areas, and this will keep out of hazardous areas where their presence is not required.

Site control is especially important in emergency situations. Paragraph (d)(2) would describe the minimum basic components of a program to control the activities and movements of employees and equipment at a hazardous waste site.

The text proposed in this paragraph, has been adapted from the interim rule. The need for site control is called for in item 9 of the EPA Order 1440.2. In addition, Subpart C of 29 CFR Part 1926 provides for regular inspection of job sites so hazards on the site can be controlled.

Paragraph (e)—Training

The proposed rule includes specific provisions for initial and routine training of employees before they would be permitted to engage in hazardous waste operations that could expose them to safety and health hazards. Section 126(b)(2) of SARA requires initial and routine training to be included in the proposal. The intent of the proposed training provisions is to provide employees with the knowledge and skills necessary to perform hazardous waste clean-up operations with minimal risk to their safety and health.

The proposed requirements for training in paragraph (e) address the needs of employees who will be working at CERCLA sites, certain RCRA sites, and sites designated for clean-up by state or local governments. The proposed provisions include a minimum of 40 hours of initial instruction off the site, and a minimum of three days of actual field experience under the direct supervision of a trained and experienced supervisor, at the time of job assignment. Congress has specifically imposed these hour and day requirements under section 126(d) of SARA for the proposed final standard. The proposed requirement is a one-time effort by the employer for each employee covered by this standard. Employees do not need to be retrained for 40 hours at each site at which they work. Employees who have received the required training at one site can use that training to meet this requirement at other sites even if it involves a different employer.

There are often many hazards at a waste site. The employee would be trained to recognize the hazards and appropriate work practices to minimize those hazards. The employee would also be well trained in the use of respirators and other forms of personal protective equipment. Without training, that equipment may not be used effectively and may not provide adequate protection. An extensive training program is necessary to assure that employees can use personal protective equipment effectively. The proposed paragraph would specify the items needed for effective training to avoid hazards.

Managers and supervisors at the waste site who are directly responsible for hazardous waste site operations would require the same training as that of employees under this proposal, and at least eight additional hours of specialized training on managing hazardous waste operations. Since these managers and supervisors are responsible for directing others, it is necessary to enhance their ability to provide guidance and to make informed decisions. Section 126(d)(2) of SARA provides that there shall be eight hours of additional training for supervisors and managers.

The provisions also propose that employees be retrained on an annual basis on relevant matters such as review of health hazards and the use of personal protective equipment. Employees at hazardous waste operations face serious health and safety risks. Reminders are needed of this and of work practices necessary to avoid hazards. Personal protective equipment provides much of this protection. If there is no retraining in the use, care, and maintenance of personal protective equipment, such equipment is unlikely to be properly utilized to provide adequate protection. The proposal would provide eight hours of annual retraining. The EPA manual for refresher training (item #10) requires this amount of training.

In all areas of training, whether it be for general site employees, supervisors at the site, or for the use of specific equipment, the level of training provided shall be consistent with the worker’s job function and responsibilities. Refresher training shall be supplied to reemphasize the initial training and to update employees on any new policies or procedures.

Section 126(d)(3) of SARA requires that the proposal include provisions for certification that an employee has received the training required by the standard. Section 126(d)(1) provides that the proposal not require training for employees who have already received equivalent training. The proposed standard has provisions to meet this directive.

OSHA requests comment as to whether this or a greater or lesser
Paragraph (f)—Medical surveillance

The proposed rule includes specific provisions for baseline, periodic and termination medical examinations. Section 126(b)(3) of SARA provides that the proposal include requirements for medical examinations of workers engaged in hazardous waste operations. In addition, the EPA manual referred to in section 126(e) of SARA has more detailed requirements for initial or baseline, periodic and termination medical examinations. The clear Congressional direction is to provide a comprehensive medical surveillance program for employees engaged in hazardous waste operations where it is medically prudent.

In paragraph (f)(1)(i) OSHA proposes that medical surveillance is to be provided to employees who have been or are expected to be exposed to hazardous substances or health hazards above established permissible exposure limits without regard to the use of respirators for 30 or more days in a 12-month period, or who wear respirators 30 days during the year. These are the employees who will be at a greater health risk, and employees who wear respirators need to be examined to determine whether they can safely do so as a routine matter. Some dividing line is needed, because employees who might be present on a hazardous waste site only a few days a year, or working in areas such as offices on the periphery of the hazardous area where exposures are low, would not have a special requirement for medical surveillance as a result of their employment. Their likely cumulative exposures to toxic chemicals would be very low, probably not significantly higher than the general population. The EPA manual indicates some dividing line is appropriate because it directs medical surveillance only for employees “routinely” exposed.

It is proposed in paragraph (f)(1)(ii) that wearing a respirator for any part of each of 30 days would require medical surveillance because such usage indicates routine exposure to toxic chemicals. There is no requirement that there be 240 hours of respirator use before medical surveillance is required. Similarly being exposed over established safe levels to several chemicals each for less than 30 days, but totaling more than 30 days per year, requires medical surveillance. This exposure indicates routine exposures to hazardous substances and also combinations of chemicals, and may cause synergistic effects creating greater health hazards than exposure to an individual chemical.

For employees who may have been exposed during an emergency incident to hazardous substances at concentrations above the permissible exposure limits without the necessary personal protective equipment being used, and for employees who are injured due to overexposure during an emergency incident, OSHA is proposing in paragraph (f)(1)(iii) that a medical examination or consultation be made available by the employer to affected employees for each incident. A continued medical surveillance program for these employees is not proposed to be required unless they also are covered under the provisions of paragraphs (f)(1)(i) and (f)(1)(ii) as discussed above. In paragraph (f)(2), OSHA is proposing the frequencies for medical examinations and consultations to be provided to employees.

OSHA’s proposal would require an initial or baseline medical examination, either prior to the start-up date for employees who are currently working at hazardous waste sites or prior to initial assignment to an area where medical examinations will be required. The purpose or the intent of baseline medical examinations is to take a detailed medical history, and where possible to develop a health baseline prior to any exposures so as to be able to evaluate changes which may be connected to hazardous substance exposures. In addition, the initial examination would permit evaluation of whether the employee can appropriately wear a respirator, and whether the employee has preexisting conditions which would make exposure to hazardous substances inappropriate. An initial examination has been required by other OSHA health standards, and is recommended in Reference 6 and required by the EPA.

The periodic examinations are required yearly. OSHA’s experience in other health standards has been that this is an appropriate period, and it is also recommended by Reference 6. EPA’s medical monitoring program guidelines cross-referenced in the EPA manual recommends baseline annual examination generally, as well as a termination examination. It is reasonable to determine periodically whether exposures have induced medical changes and to identify conditions caused by chemicals at an early stage to permit more effective treatment. In some circumstances, the physician may advise more frequent examinations. OSHA requests comment on whether yearly or another frequency for periodic examinations is most appropriate.

Examinations are also to be provided when the employee brings to the employer’s attention signs or symptoms indicating possible overexposure to hazardous substances. The employee is to be trained in recognizing what symptoms may indicate that the employee has been exposed to a hazardous substance. Examples of such systems may be dizziness or rashes. Examinations are also required, when medically appropriate, during emergencies when exposure to higher levels is possible. For example, a urinary phenol test is appropriate for employees exposed to high levels of benzene.

Finally, employees who have been required to have medical examinations must also be given an examination upon termination of employment, or upon reassignment to an area where medical examinations are not required. This examination is proposed to detect conditions which have developed prior to departure and is recommended by the EPA program. The proposed provision does not require a termination examination if the employee has had an examination within the prior six months. The EPA guideline has that exception, but qualifies it only if the employee has had no significant exposures in the interval. OSHA requests comments on the appropriate provisions for a termination examination.

In paragraph (f)(3), OSHA would establish the content of medical examinations and consultations provided to employees.

In situations where most of the employees on the site have similar exposures, the protocol may be similar for all employees. Where different groups of employees on the site have substantially different exposures, several different protocols may be appropriate for the site’s workers depending on exposures.

There are a number of sources for guidance on specific medical examination protocols. Chapter 5 of Reference 6 provides such guidance by groups of chemicals likely to be present on a site. It references other authorities. The manual should be supplied to the physician. It is also a basis for the medical surveillance program required by this paragraph. In addition, the EPA medical monitoring program guidelines referenced by the EPA manual provides guidance on specific protocols.

In paragraph (f)(4), OSHA proposes that the medical examination would have to be provided under the supervision of a licensed physician. As
OS-IA requests comment on whether physician can also judge whether the respirator. As employees on hazardous examinations depend on the substances that the appropriate medical tests and taking and waiting for the examination. paid regular wages for the time spent proposed that the employee shall be pay for that time. If the examination is given outside regular working hours, it is proposed that the employee shall be paid regular wages for the time spent taking and waiting for the examination.

In paragraph (f)(6), OSHA proposes that the appropriate medical tests and examinations depend on the substances to which an employee is exposed, and to whether or not the employee wears a respirator. As employees on hazardous waste sites may be exposed to differing substances, the proposed paragraph can not specifically state the required tests. Consequently the proposal states that the employer provide to the physician information on exposures, respirator use, and duties on the site. The physician is then to determine the appropriate medical surveillance protocol in terms of specific tests and examinations. As a result of the employer specifying duties, the physician can also judge whether the employee can handle the physical difficulty of the work. OSHA requests comment on whether it should include protocol for medical surveillance, and if so what that protocol should be.

In paragraph (f)(6) OSHA is proposing that the physician make a report to the employer of medical conditions which may make the employee at increased risk to work at the site, and any recommendations or limitations on use of respirators and other PPE as a result of the medical conditions. This will provide guidance for the safe employment of the employee at the site. Under the proposal, the physician could not reveal to the employer diagnoses or conditions unrelated to employment, but could inform the employee directly of those conditions and any and all occupationally related conditions. OSHA requests comment on whether medical removal protective provisions are medically necessary, feasible and appropriate.

In paragraph (f)(7) OSHA would that appropriate records be kept to assist in future evaluation of the employee’s health. Secondarly, this information may assist in research on occupational related disease. It is proposed that records should be kept pursuant to the provisions of 29 CFR 1910.20. Full consideration was given in that standard to appropriate retention periods.

OSHA specifically requests comment on whether these or other criteria are the most appropriate for determining which employees should receive medical surveillance, taking into account both medical and administrative factors.

Paragraph (g)—Engineering Controls, Work Practices, and Personal Protective Equipment

It is proposed that anyone entering a hazardous waste site be protected against potential hazards. The purpose of proposing engineering controls, work practices, and personal protective equipment (PPE) is to shield or isolate employees from the chemical, physical, and biologic hazards that may be encountered at a hazardous waste site. Careful selection and use of appropriate engineering controls, work practices, and PPE should protect any employee from health and other hazards, including hazards to the respiratory, skin, eyes, face, hands, feet, head, body, and hearing.

Congress requested in section 120(b)(4) and (5) of SARA that the proposal have provisions for the use of engineering controls and personal protective equipment. Section 120(b)(6) states that the proposal shall contain "requirements for maximum exposure limitations for workers engaged in hazardous waste operations." In addition existing OSHA regulations which apply in general to hazardous waste operations, in 29 CFR Part 1910. Subpart Z, require exposures to various toxic and hazardous substances to be controlled with engineering controls if feasible, otherwise with PPE.

Paragraph (g)(1) would carry over the existing requirements of the interim rule. It provides that toxic and hazardous substances regulated by OSHA are to be controlled to the permissible exposure limit with engineering controls if feasible. If such control is not feasible, the exposure is to be controlled with PPE.

Paragraph (g)(2) would provide that to achieve as appropriate established exposures levels for substances not regulated by OSHA in Subpart Z, the employer may use an appropriate combination of engineering controls, work practices, and PPE.

OSHA believes that the approach in paragraph (g)(2) accurately reflects Congress’ guidance. OSHA requests comment on whether the approach it has followed is appropriate for hazardous waste operations and is protective of workers, taking into account that in some circumstances engineering controls are not available for those operations, and also the large number of chemicals which may be present at such sites.

OSHA is currently considering upgrading its respirator protection requirements and is reviewing its current methods of compliance policy to determine if revision would be appropriate. A proposed rule on methods of compliance is scheduled for later in 1987. If as a result of this review the general policy is modified, these modifications would also apply to this standard.

Examples of engineering controls which may be feasible are pressurized cabs on materials handling equipment, or pressurized control rooms in materials handling areas. However, in many cases personal protective equipment will be the only feasible means for providing protection to employees engaged in hazardous waste operations.

It is proposed that the selection of personal protective equipment (PPE) be based on the information obtained during the site characterization and analysis, as is proposed by paragraph (g)(3)(i) of this standard. Once an estimate of the types of hazards and their potential concentration has been obtained, the proper respirators and protective clothing can be selected based on the performance characteristics of the PPE relative to the site hazards and work conditions, as is proposed by paragraph (g)(3)(ii) of the standard. These requirements are derived from Reference 6, and are also supported by a NIOSH document, “Personal Protective Equipment for Hazardous Materials Incidents: A Selection Guide.” These two documents also support the proposals of paragraphs (g)(3)(iii) and (g)(3)(iv) which would require positive pressure respirators with escape provisions to be used in IDLH atmospheres, and totally-encapsulating chemical protective suits to be used where skin absorption of the substance would result in an IDLH situation.

Paragraph (g)(3)(v) would require that the level of protection provided by PPE selection be increased when additional information on site conditions show that increased protection is necessary. The purpose of this regulation is to assure that employees do not become exposed to levels of hazardous substances above what is permitted after initial monitoring has been completed. It is possible that increased protection may become necessary due to unexpected releases of unknown substances or due to new
Paragraph (g)(3)(v) would require that PPE be chosen to keep exposures at or below established permissible exposure limits. This is a restatement of paragraph (g)(3)(vi) of the interim rule.

Proper respirator selection, as proposed by this standard, involves providing sufficient protection factor through the type of respirator used, respirator fitting, worksite conditions, and respirator selection and use program. Proper protective clothing selection, as proposed by this standard, involves choosing protective clothing made of materials and construction which will prevent breakthrough of hazardous substances by permeation and penetration, or will reduce the level of exposure to safe level during the employee's duration of contact. Information on the performance characteristics of PPE is available from MSHA/NIOSH certifications, test reports and manufacturer's literature. OSHA is proposing an Appendix B that would provide non-mandatory guidelines on classifying substance hazards at four levels (A, B, C, and D), and on matching four levels of appropriate protection provided by different protective ensembles. These guidelines may be used as a basis for protective clothing selection, and the selection further refined when more information is obtained, as proposed in paragraph (g)(3)(v) of the standard. In certain circumstances, this standard would specify the appropriate level of protection. See paragraph (c)(4)(iii).

Paragraph (g)(3)(vi) would cross-reference the existing requirements to select and use PPE pursuant to the requirements of 29 CFR 1910, Subpart I.

In paragraph (g)(4), OSHA proposes to require totally-encapsulating suit materials used for Level A protection (the highest level of protection) to provide protection from the specific hazards which have been identified as requiring that level of protection. The purpose of this proposal is to be certain that the suit selected is comprised of materials which will provide the necessary protection, since no one material will provide protection from all hazards. Paragraphs (g)(4)(ii) and (g)(4)(iii) would require totally-encapsulating suits to be capable of maintaining positive air pressure to help prevent inward leakage of hazardous substances, and to be capable of preventing inward gas leakage of more than 0.5 percent. These proposals, which are based on testing of totally-encapsulating suits, are included to establish minimum level of suit performance so that their level of protection can be quantified for proper selection. OSHA is proposing in Appendix A to list the example test methods for totally-encapsulating chemical protective suits. OSHA believes that higher degree of leak protection than 0.5 percent may be appropriate if both practical suits and test methods are to achieve and demonstrate greater levels of protection. OSHA also believes that qualitative test methods utilizing non-hazardous challenge agent or quantitative test method for the suits would be preferable. It requests comments on these issues.

In paragraph (g)(5), OSHA would require the PPE program to be established as part of the site safety and health plan. This proposal is based upon reference 6, 29 CFR 1926.28, EPA manual items 4 and 7(g), and is included since PPE will be the only protection feasible for employee protection, in most cases, and because the amount of protection afforded by PPE is dependent upon so many factors, such as selection, fit, work duration and conditions, and decontamination. The PPE program would be required to insure that the level of protection afforded by PPE is sufficient and continues to be sufficient for employee safety during hazardous waste operations.

**Paragraph (h)—Monitoring**

It is essential that employers be provided with accurate information on employee exposures in order to implement the correct PPE, engineering controls, and work practices. Airborne contaminants can present a significant threat to employee safety and health. Thus, identification and quantification of these contaminants through air monitoring is an essential component of safety and health program at hazardous waste site. Reliable measurements of airborne contaminants are useful for selecting personal protective equipment, determining whether engineering controls can achieve permissible exposure limits and which controls to use, delineating areas where protection is needed, assessing the potential health effects of exposure, and determining the need for specific medical monitoring. Section 126(b) of SARA also mandates the inclusion of the necessary monitoring and assessment procedures in this proposed rule.

In paragraph (h)(2), OSHA is proposing to require monitoring for airborne hazardous substances at uncontrolled hazardous waste sites. The purpose is to detect IDLH conditions, flammable conditions, or exposures to hazardous substances. Over exposure limits can be detected and controls can be instituted or suitable PPE selected and worn to protect employees from the hazard. Representative initial monitoring would be required for these conditions. Subsequent monitoring would be required whenever the possibility of an IDLH or flammable atmosphere has developed.

In paragraph (h)(3), OSHA proposes that additional monitoring is necessary when, as result of various changes, increased exposures are suspected. No specific interval of monitoring is proposed because the variations present at each individual work station. Monitoring would not be required just because condition changes; it would be necessary only when the change may lead to higher exposures.

In paragraph (h)(4), OSHA proposes to continue requiring personal monitoring of high-risk employees as is contained in paragraph (h)(4) of the interim final rule. The language of the proposal differs from that of the interim rule. However, the requirement remains the same. A note has also been proposed to clarify the intent of the proposed requirement. The language of this paragraph was adapted from reference 6.

Because of the large number of substances which may be present at hazardous waste site, OSHA does not believe it is possible to specify detailed monitoring protocol as it has done in substance specific standards. OSHA requests comments on whether alternate monitoring provisions would be more appropriate.

**Paragraph (i)—Informational Programs**

Congress provided in §129(b)(7) of SARA that the proposal include an "Informational Program" to "inform workers engaged in hazardous waste operations of the nature and degree of toxic exposure likely as a result of such hazardous waste operation. Paragraph (i) in the proposal is designed to carry out this Congressional directive.

Paragraph (i) provides that employees, contractors, and subcontractors (or their representatives) be informed of the hazardous substances health hazards and other hazards to which they are exposed.

Employees covered by this proposal will normally be informed as part of their initial and refresher training
required by paragraph (e). Some of the training time required in paragraph (e) can be allocated to this information so that this provision does not increase training time over that which Congress has directed.

This provision is intended to cover employees who are exposed to greater hazards than the general employee population. Consequently a clerk in an office on the periphery of a site who does not enter the operations part of a site, and is exposed only to background levels of hazardous substance, would not be covered. Employees who regularly enter the operations areas on the site and are exposed to levels significantly over background would be covered.

The information program should concentrate on those substances which will create the greater risk to the employee, either because of their hazardousness or because of the likely higher degree of exposure, and for which precautions are most essential. For example, a level of exposure not higher than background to a general population would not normally require notification. Similarly a level of exposure above background, but well below established permissible exposure limits of chemicals, would not require the specific notification of this provision.

The identification of exposure level provisions are tied in with the monitoring provision of the standard, and do not create requirements to monitor additional to those created elsewhere in this proposed standard. Similarly there is no requirement to make risk estimates or to undertake original research on the degree of risks. The requirement is to inform the employee, contractor, or subcontractor of estimates in the literature or made by authoritative organizations. As the employers here are in the business of handling hazardous wastes, they should be familiar with this literature in order to manage their operations properly. Therefore extensive literature searches should not be necessary.

OSHA requests comments on whether these or other provisions of the proposal are a more effective method than the method used in the interim final rule for informing employees of the hazards they face in a manner that concentrates on the more important hazards and the methods by which they can be controlled.

Paragraph (j)—Handling Drums and Containers

In paragraph (j), OSHA is proposing procedures for the handling of drums and containers. The handling of drums and containers at hazardous waste sites poses one of the greatest dangers to hazardous waste site employees. Hazards include detonations, fires, explosions, vapor generation, and physical injury resulting from moving heavy containers and working around stacked drums, heavy equipment, and deteriorated drums. While these hazards are always present, proper work practices can minimize the risks to site personnel. Section 126(b)(6) of SARA directs that the proposal contain provisions on the handling and storage of hazardous substances and this paragraph addresses that concern.

Containers (less than 30 gallons) are also handled during characterization, removal of their contents and during other operations. Many of the hazards encountered during the handling of drums also occur during the handling of smaller containers. The relative size of a smaller container when compared to the size of a drum is no indication of the degree of hazard posed by the container. They both should be treated in accordance with the level of hazard posed by their contents not by their size. The language used in this paragraph was adapted from Reference 6.

Paragraph (k)—Decontamination

Section 126(b)(10) of SARA provides that the OSHA proposal contain requirements for decontamination procedures. Decontamination is a necessary practice to protect those employees properly who may be exposed to hazardous substances. Decontamination provisions protect an employee from being exposed to hazardous substances which might otherwise be on the employee's PPE when it is removed. OSHA is proposing that a decontamination plan be developed and implemented before any employees or equipment may enter areas on site where potential exists for exposure to hazardous substances. As proposed in this standard, decontamination procedures and areas must be developed to minimize hazardous exposures to employees whose equipment and PPE are being decontaminated, as well as to employees who are assisting in the decontamination of workers and equipment. These measures are proposed since without proper procedures and decontamination areas, employees may be unknowingly exposed to hazardous substances which have contected or otherwise adhered to equipment and clothing. OSHA is also proposing that all employees be decontaminated and that all clothing, equipment and decontamination fluids and equipment be decontaminated or disposed of before leaving a contaminated area. These provisions are proposed so that contaminated persons and materials do not leave the "hot zone" and thereby expose other employees and persons to hazardous substances.

Decontamination methods and cleaning fluids must be matched to the particular hazardous substance at the site in order for the decontamination procedures to be effective in removing the hazards from PPE and other equipment. No one decontamination fluid will be effective for all hazardous substances. As proposed in this standard, the decontamination program must be effective and it must be monitored by the site safety and health supervisor to maintain its effectiveness. These proposals are made so that employees are not exposed to hazardous substances by re-using PPE and other equipment which are still contaminated. "Effective employee decontamination also requires clean change rooms and showers. There must be an area where the employees can remove the contaminated work clothing and where it will not contaminate the employees' street clothing. In addition, the employees must be able to shower after removing contaminated work clothing and then go into a clean area where the employee can put on street clothing. Paragraph (k) contains these decontamination requirements. Somewhat different provisions are required for areas of less than six-month duration because more permanent facilities are not as feasible for short-term operations. The language used in this paragraph was adapted from reference 6.

Paragraph (l)—Emergency Response

Section 126(b)(11) of SARA specifically provides that the proposal contain "requirements for emergency response." In addition, the EPA manual under Items 4 and 9, and 29 CFR 1926.23 and 1926.24 require preparations and planning for emergencies. Congress made its intent clear that emergency planning and response is an important part of any employer's safety and health program, and directed that it is to be addressed in the proposed rule.

The Congressional concerns on toxic emergencies is discussed in Task Force on Toxic Emergencies, Environmental, and Energy Study Conference Special Report, September 16, 1986. This report stresses the need for training of emergency response personnel as well as emergency response planning and related areas.

In paragraph (l)(1)(i), Emergency Response, General, OSHA is proposing
that employers who are involved in emergency response to hazardous waste incidents develop and implement an emergency response plan for emergencies. Employers would have to inform all their employees about the emergency response plan. The plan would also have to be available for use prior to the start of work on the site. It would have to be in writing and available for inspection by employees, their representatives, and OSHA personnel. OSHA proposes to exempt employers from the rest of paragraph (1) if they provide an emergency action plan in accordance with 29 CFR 1910.38 that requires the total and immediate evacuation of employees from the release site.

In paragraph (1)(3)(i), OSHA is proposing that the emergency response plan include the following elements: (1) Recognition of emergencies; (2) methods or procedures for alerting employees on site; (3) evacuation procedures and routes to places of refuge or safe distances away from the danger area; (4) means and methods for emergency medical treatment and first aid; (5) line of authority for employees; (6) decontamination procedures; and (7) site control means and methods for evaluating the plan.

Local fire departments, police departments or emergency medical services would also be required to have an emergency response plan. These employees which may be called upon to respond to hazardous substance emergency incidents involving a railroad tank car, motor carrier tank truck or to a plant location where they do not regularly work are considered involved in emergency response activities at other than hazardous waste clean-up sites under this section. However, work by maintenance or repair personnel who are called upon to replace a leaking valve or a section of pipe damaged by an unexpected release, or to restore a highway surface or railroad track bed that may have been damaged in an accident causing the release of a hazardous substance, are not considered as being part of the "emergency response" for the purpose of this proposal. Such employees routinely respond to accident sites to restore equipment to a functional level after an accident has occurred. Typically the accident scene will have been declared "non-hazardous" in regards to employee exposure to hazardous substances. Should a health exposure exist, these employees would be covered by OSHA's General Industry health standards in Subpart Z. Safety hazards related to their work would be covered by the appropriate Part of Title 29 related to their work (i.e., 1910, 1926, etc.).

The emergency response plan would have to include the incident command system required in paragraph (1)(3) of this section. OSHA believes that a generic emergency response plan is feasible for employers.

In paragraph (1)(3), Emergency response at hazardous waste clean-up sites, OSHA is proposing requirements for emergency response at hazardous waste clean-up sites. The title for this paragraph would be changed from the title "On-site emergency response" as used in the interim rule to "Emergency response at hazardous waste clean-up sites" to clarify the intent of the type of response OSHA is proposing to cover in this paragraph. Further the term "on-site" would be replaced with the phrase "at hazardous waste clean-up site" as appropriate.

An employer's emergency response personnel at hazardous waste clean-up site operations must have the same basic training as for the other employees involved in routine hazardous waste clean-up operations plus the training needed to develop and retain the necessary skills for anticipated emergency response activities. CERCLA sites, major corrective actions at RCRA sites, sites designated for clean-up by state and local governments and other similar hazardous waste clean-up sites require more training because there is the possibility of uncontrolled hazards.

Note.—Emergency response personnel from other places of employment of different employers who respond to the site must comply with the training requirements of paragraph (1)(3).

In paragraph (1)(3), Emergency response at other than hazardous waste clean-up sites, OSHA is proposing requirements for emergency response at other than hazardous waste clean-up sites. The title for this paragraph would be changed from the title "Off-site emergency response" as used in the interim rule to "Emergency response at other than hazardous waste clean-up sites" to clarify the intent of the type of response OSHA is proposing to cover in this paragraph. Further the term "off-site" would be replaced with the phrase "at other than hazardous waste clean-up site" as appropriate.

Fire departments, emergency medical and first-aid squads, fire brigades, and other similar emergency response teams would have to conduct monthly training sessions for their employees, except as provided in (1)(3)(i)(A)(2) and (1)(3)(i)(A)(4). Regular training is needed so that the employees with responsibility for controlling, containing and extinguishing fires of hazardous substances know the proper techniques and equipment to use. They must also know the appropriate PPE to use and how to wear it and how to coordinate with fellow employees. Without this knowledge their lives would be in jeopardy. The training needs to be recurring because quick decisions will have to be made in the dangerous emergencies of chemical fires, acid spills, poisonous fumes, etc. where there often will not be time to consult manuals and the information needs to be fresh and accurate in the employees' minds.

Some changes have been made in the proposal from the interim rule. The interim rule required 24 hours of training during and monthly sessions. OSHA believes that a reasonable amount of training required and it is retained as an option in the proposal.

However, a prescription of a number of hours does not necessarily indicate proficiency and employees could develop proficiency in fewer hours. Therefore, OSHA is proposing an alternative. The alternative would provide that employees be trained sufficiently so that they demonstrate competency in the relevant areas of their duties.

In addition, the interim rule clarifies that training need be given only to those employees who will be engaged in controlling toxic chemical fires and containing spills. Employees who may be first on the scene, but not expected to engage in response activities, may be trained only in hazard recognition if they are instructed to call others to control hazardous substance spills and fires. Employees for whom the possibility of making an emergency response need not be trained in making such a response.

In addition, the proposal clarifies that the intent of the training requirements is to ensure that fully-trained personnel are available to respond to hazardous substance emergencies. Accordingly, each individual emergency response organization is not required to have a fully-trained hazardous substance response team if arrangements have been made in advance to ensure that such a team is available to respond in a reasonable period if summoned. If any emergency response organization chooses to rely on an outside team for hazardous substance emergencies, then its members must be sufficiently trained to recognize an emergency situation exists which requires the intervention of the designated hazardous spill response team and to know how the spill response team should be contacted. An
example may be a metropolitan area in which an emergency spill team is available to respond immediately to spills anywhere within the area. In such a case, each emergency response organization in the area would not have to train individual members to the degree specified in paragraph (l)(3)(i)(A)(2) if the members knew when and how to call in the designated spill response team. However, the employees fully trained must be sufficient to handle reasonable possible emergency response situations. There are additional requirements for HAZMAT teams because they face the greater hazards of stopping leaks of hazardous chemicals.

It is noted that OSHA does not have direct jurisdiction over state and local government employees. OSHA state plan states must regulate state and local government employees in the state. State and local government employees in non-OSHA state plan states will be covered by EPA. [See section 126(f) of SARA.]

Training sessions on activities such as breathing apparatus use, hose handling and preplanning may be used as training subjects for the monthly sessions, hazardous substance incident operations are included in the presentation, discussion or drill. It is proposed that these training sessions and drills contain at least 24 hours of training on an annual basis. It is also proposed that an incident command system be established by employers for the incidents that will be under their control, and that the system be interfaced with the other organizations or agencies who may respond to such an incident. The National Transportation Safety Board, as a result of its investigation of hazardous materials incidents, has consistently recommended that better state and local emergency response planning be done to reduce the loss of life and property, and that a system using a command post and on-scene commander be implemented. [See Special Investigation Report: On-scene Coordination Among Agencies at Hazardous Materials Accidents, NTSB-HZM-79-3, September 13, 1979, and Multiple Vehicle Collisions and Fire, Caldecott Tunnel near Oakland, California, NTSB/HAR-83/01, National Transportation Safety Board, Washington, DC, April 7, 1982, for further information.] OSHA is proposing that where available, state and local district emergency response plans would be utilized in developing the incident command system and the emergency response plan to assure compatibility with the other emergency responding agencies or employers.

In paragraph (l)(4), Hazardous materials teams, OSHA is proposing to require employers who utilize specially trained teams involved in intimate contact with controlling or handling hazardous substances, to provide special training for the affected employees in such areas as care and use of chemical protective clothing, techniques and procedures for stopping or controlling leaking containers, and decontamination of clothing and equipment after hazardous substance incidents. The employer would have to implement a medical surveillance program in accordance with the proposed requirements of paragraph (f) of this section. It should be noted that employees of employers covered by paragraph (a)(2)(ii) already would receive these protections as a result of other provisions in this proposal. However, this paragraph does not require any employer to form or organize a hazardous materials team. It only applies when such a team has been organized and utilized.

In paragraph (l)(5)(i), OSHA is proposing to require that employers who will be involved in cleaning up hazardous waste after the emergency response activities are concluded, comply with the same requirements that apply to others involved with hazardous waste clean-up operations. These hazardous waste clean-up operations will be typically accomplished by special contractors, and not by those agencies involved in responding to the initial emergency incident. However, this paragraph does not apply to those employees who clean-up a spill in their work area which did not involve an emergency response by the fire brigade, fire department or similar organization.

After an emergency response incident is brought under control on plant property, and post-emergency clean-up of hazardous materials begins, paragraph (l)(5)(ii) would permit the employer whose facility was affected by the incident to use plant employees to decontaminate the workplace. This provision has been addressed and permitted in the past by specific OSHA health standards such as 29 CFR 1910.101(b)(2)(ii), 29 CFR 1910.1058(d)(2) and others. The employees who may take part in the clean-up would have to have completed the full training program required in 29 CFR 1910.1200, and the respirator training required in 29 CFR 1910.134. Emergency action plans would have to be provided in accordance with §1910.38(a). Any appropriate safety and health training required by the specific tasks to be completed as part of the clean-up effort would also have to be provided. Employers whose employees will be performing post-emergency cleaning of workplaces would be exempt from paragraph (l)(5)(i) of this section if they comply fully with paragraph (l)(5)(ii) of this section.

OSHA requests comment on whether the proposals it has made and distinctions it has drawn for emergency response are appropriate, or whether improvements can be made.

Paragraph (m)—Illumination

In paragraph (m), Illumination, OSHA is proposing to require certain minimum illumination levels for work areas that are occupied by employees. OSHA was mandated by SARA in section 128(e) to include illumination requirements in the interim final rule published in December 1986. OSHA believes that the intent of Congress is to provide coverage concerning illumination, and has therefore proposed to regulate it in this proposed final standard. The provisions come from OSHA's construction industry requirements for illumination at construction sites issued at 29 CFR 1926.56. SARA calls upon OSHA to use the requires of Subpart C in Part 1926, Subpart C references the requirements of Subpart D which contains §1926.56. OSHA request comment on whether these or other provisions are more appropriate for hazardous waste operations.

Paragraph (n)—Sanitation for Temporary Worksites

In paragraph (n), Sanitation for temporary worksites, OSHA is proposing minimum requirements for portable and non-portable water supplies, toilet facilities, and other areas related to sanitation at temporary workplaces. OSHA was mandated by SARA in section 126(e) to include sanitation requirements in the interim final rule. The provisions in this proposed standard come from OSHA's construction industry requirements for sanitation at construction sites issued at 29 CFR 1926.51 with one addition. SARA calls upon OSHA to use the requirements of Subpart C in Part 1926. Subpart C references the requirements of Subpart D which contains §1926.51. OSHA is proposing to expand the referenced construction standard in this rulemaking with requirements for showers and change rooms. Regulation of these facilities was not a part of the interim final rule. The proposed addition has been made to address the installation and operation of employee.
showers and change rooms at worksites where clean-up operations are expected to take six months or more to complete.

OSHA requests comments on whether these or other provisions are more appropriate for hazardous waste operations.

OSHA is proposing a separate paragraph for operations conducted at worksites involving hazardous waste storage, disposal and treatment operating under the Resource Conservation and Recovery Act of 1976 (RCRA). This separate paragraph of requirements is appropriate because RCRA site operations (not including major corrective actions and their associated hazards which are similar to CERCLA sites, and are covered by the main part of the standard) generally are different from the operations and hazards found on a CERCLA clean-up site. For example, RCRA sites that would be covered by this paragraph tend for the most part to be fixed ongoing operations involving the receiving, processing, storage, treatment, and disposal of hazardous wastes or substances from outside sources. CERCLA sites, on the other hand, are temporary emergency clean-up operations involving often undefined and substantial quantities of hazardous substances.

Consequently hazards should be better controlled and more routine and stable for the RCRA sites covered by this paragraph, and therefore less extensive requirements are appropriate. OSHA requests comment on whether the provisions of paragraph (o) are appropriate for general RCRA sites.

In paragraph (p), New technology programs, OSHA proposes to address new technology programs. New technology programs are intended to provide employees with means to become aware of new equipment, processes, and procedures that may contribute to improving their safety and health on the job. Paragraph (b)(9) of SARA also requires the agency to address new technology programs as part of this proposal.

III. References

IV. Issues for Comment

OSHA requests comments on all issues raised by this proposal, including the issues specifically raised throughout the preamble. OSHA also requests comment on the following issues:

1. Ninety days after the promulgation of the final OSHA regulations that result from this notice of proposed rulemaking, section 126 (f) of the Superfund Amendment and Reauthorization Act of 1986 (SARA) requires the Administrator of the Environmental Protection Agency (EPA) to promulgate standards identical to those promulgated by OSHA pursuant to this rulemaking for employees of State and local governments in each state which does not have in effect an approved State plan under section 18 of the Occupational Safety and Health Act of 1970. EPA is to provide standards for the health and safety protection of employees engaged in hazardous waste operations. Does the requirement that EPA apply identical standards to employees of State and local governments engaged in hazardous waste operations raise any issues about the substance of the standards that would not be raised by their application to other workers? EPA will conduct its own rulemaking to define those employees to whom the standards will apply.

2. OSHA has defined the term "established permissible exposure limit" to cover the many hazardous substance and health hazards possibly present in hazardous waste operations. Is another definition or term more appropriate and, if so, how should it be defined? Should several terms be used for different purposes, such as site entry or guidance on use of PPE? How should OSHA determine safe levels of exposure for unknown substances or mixtures of substances?

3. In order to perform a Regulatory Impact Analysis and a Regulatory Feasibility Analysis for the final standard, OSHA requests information concerning the following general topics: The type, number, and characteristics of the contractors and other entities involved in hazardous waste operations; the number of potentially affected employees at hazardous waste operations; the available fatality, injury, and illness statistics associated with hazardous waste operations; current industry practices in hazardous waste operations; the potential costs of compliance; and the potential economic impact of the proposed standard upon the economy and upon small entities. In addition to any other information that is supplied on these issues, OSHA is particularly interested in information concerning the specific questions found in Issues 4 through 18. OSHA already has substantial information in these areas, but more information would be helpful in improving the regulation and making more detailed estimates of impacts.

4. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

5. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

6. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

7. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

8. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

9. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

10. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

11. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

12. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

13. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

14. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

15. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

16. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

17. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?

18. What type of contractors and other entities are involved in hazardous waste operations? How many are there? What are their characteristics? What is the typical scale of clean-up operations?

19. What are the characteristics of these firms? Are they typical of construction firms (particularly excavation contractors) in general or not? Are these contractors able to specialize in work at uncontrolled hazardous waste sites?
these emergency spills are cleaned up by private contractors? Are these private contractors the same as those contractors performing hazardous waste clean-ups on hazardous waste clean-up sites? How often are emergency spills cleaned up by state and local employers? How many fires occur that require state and local firefighters to enter a hazardous waste site? 7. Do industrial establishments with industrial fire brigades generally ask those brigades to respond to in-house hazardous material spills or releases? If not, who does respond? Are other response groups designated? What provisions do other establishments (i.e., those without brigades) make for responses to hazardous material spills or releases? 8. How may private HAZMAT teams (response groups) are there? Are many of the teams designated for responses for several emergency networks (e.g., for responding to CHEMNET emergencies, Chlannore Institute emergencies and others?) How many HAZMAT specialists, hazardous materials consultants, or other groups are there that may respond to incidents but who do not physically get involved in the response action? 9. How many employees are exposed to hazardous substances during clean-ups at a typical CERCLA site, at a typical RCRA site; and at an emergency spill? What are the typical hazardous substances found at a CERCLA site and at a RCRA site? What are the typical exposure levels? How many average daily hours of exposure to site hazards would a typical employee face during clean-up operations, and during final site reclamation work? At how many waste sites does the average employee work during a year? What are the training and experience levels of these employees? What is the labor turnover rate? What percentage of these employees have previously worked at CERCLA or RCRA sites? 10. The proposed standard covers employers and employees engaged in operations regulated under 40 CFR Parts 264 and 265 pursuant to RCRA. Are there other RCRA operations involving hazardous waste handling covered by other Parts in Title 40 of the Code of Federal Regulations which OSHA should include in the scope of this standard? Are there any other paragraphs of this proposal not specifically referenced in paragraph (o) for applicability to RCRA sites that should be made applicable to RCRA sites? 11. What are the current industry practices with respect to the provisions in the proposed standard? What actions would be necessary for compliance? Does the current degree of compliance depend upon the type of site? Are there any provisions that would, in some specific situations, be either technologically or economically infeasible? What would those specific situations be? 12. How much training is being provided for various types of employees? Who has provided this training? How often is training repeated? Are truck drivers who haul the hazardous substance from the site trained and, if so, to what extent and by whom? Are monthly drills or other training provided for emergency responders to spills? 13. What preparations are made for emergency situations that may arise at CERCLA or RCRA hazardous waste sites? 14. What are the typical practices concerning air monitoring? How extensive is the information concerning the specific hazardous substances at a CERCLA site and at a RCRA site? 15. Do employees receive medical exams prior to the first site assignment? Are exit exams provided? Are medical exams given annually? Are these exams given to HAZMAT team members? Which tests and analyses are included in the medical exam? 16. Is personal protective equipment used in accordance with the proposed standard? If not, why not? Is a self-contained breathing apparatus worn at all times during emergencies with hazardous substances? If not, what types of instances might not require their use? 17. What sources of fatality, illness, or injury statistics are available for hazardous waste operations? What are the causes of these fatalities and injuries? What types of site characteristics or employee actions have contributed to fatalities and injuries? Are there specific cases of acute or chronic illnesses occurring to employees performing hazardous waste operations? Would specific provisions in the proposed standard prevent these cases? Which provisions? 18. What would be the unit costs of complying with each of the provisions for which there is current non-compliance? What would be the annual costs by provision and by site? What would be the capital costs? What would be the one-time expenditures? What would be the typical total, annual and capital costs of compliance for a contractor? What would be the typical receipts, profits, and investment of these firms? How would this cost of compliance be offset onto the price of the clean-up operation? What would be the typical impact of compliance upon the price charged to clean-up of a CERCLA site, a RCRA site, and a private site? Would small entities be faced with an adverse impact that would be significantly greater than the adverse impact faced by the larger entities? If so, what particular provisions would cause this impact? 19. OSHA is proposing certain training requirements for employees who are expected to work with hazardous substances. The Agency proposes to require certification to show that training has been completed. Should it set criteria for the persons doing the training? Is the requirement of a written certification upon completion of training given to the employee sufficient to show that training has been completed? With regard to the various training requirements in the standard, should OSHA require specific training courses or curriculum? What should a training program or curriculum include? If the employer is allowed to certify that an employee has been trained, what format should this certification follow? 20. In the issue of medical surveillance and the surveillance records necessary to show employee exposures, how should OSHA provide for records transfer when an employee moves from one job site to another job site, or from one employer to another employer? 21. Test methods for evaluating the performance of totally-encapsulating chemical protective suits are included in Appendix A of this standard. A pressure test using compressed air and a qualitative leak test using vapors from concentrated aqueous ammonia are included. Are these test methods adequate for ensuring the integrity of totally-encapsulating chemical protective suits? Are other test methods available which would be more suitable? Is there a danger to employees from the use of such a volume of concentrated aqueous ammonia? 22. The standard and appendices do not contain any test methods for other chemical protective clothing such as overalls, chemical-splash suits and chemical-resistant gloves. Are there any tests methods available which evaluate the performance of these types of protective clothing and gloves as they would perform when worn? Is there a need to include test methods for chemical protective clothing and gloves? 23. The standard requires that clothing and equipment leaving a contaminated area be appropriately disposed of or decontaminated. What methods are available to evaluate the effectiveness of decontamination procedures? What methods are available to determine when decontaminated clothing and
equipment are safe to reuse? What guidelines or procedures are available to ensure proper disposal of contaminated clothing and equipment?

24. The practical health benefit of annual medical examinations for workers in hazardous waste operations may be, however, uncertain. Hazardous waste operations often involve exposure to numerous chemicals some of which may be unknown, to which workers may be exposed once, intermittently, or regularly. Consequently, it may not be possible to determine in advance what particular biological markers are relevant in determining over-exposure; which medical tests should be conducted; or even if the same medical tests should be conducted with each yearly examination. One consequence of this uncertainty may be over-testing—the application of a battery of medical tests simply in order to cover the full spectrum of possibilities. Such testing would be costly and in some circumstances of limited health benefit, and would not assure the worker that health effects have not occurred as a result of over-exposure. This situation differs from that in most other activities regulated by OSHA, in which specific exposures have been identified and specific tests can be conducted to determine if workers have been over-exposed.

Since, in some circumstances, it may not be possible to determine in advance what doctors should look for in workers engaged in hazardous waste operations, it may be more useful to follow the initial or baseline exam with periodic examinations of those workers who show symptoms indicating sensitivity or possible over-exposure to hazardous substances. Follow-up exams would occur at intervals recommended by the physician. The effectiveness of this approach in identifying workers in need of medical surveillance would be enhanced by worker training on recognition of symptoms indicating possible over-exposures. OSHA solicits comments on the appropriateness and effectiveness of this alternative to annual medical examinations.

V. Regulatory Impact Analysis, Regulatory Flexibility Analysis and Environmental Impact Assessment

Introduction. Executive Order 12291 (46 FR 13197, February 19, 1981) requires that a regulatory impact analysis be conducted on any rule having major economic consequences for the national economy, individual industries, geographical regions, or levels of government. In addition, the Regulatory Flexibility Act of 1980 (Pub. L. 96–353, 94 Stat. 1164 [5 U.S.C. 601 et seq.]) requires the Occupational Safety and Health Administration (OSHA) to determine whether a proposed regulation will have a significant economic impact on a substantial number of small entities, and the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321. et seq.) requires the agency to assess the environmental consequences of regulatory actions.

In order to comply with these requirements, OSHA has prepared a Preliminary Regulatory Impact and Regulatory Flexibility Analysis (PRIA) for the proposed hazardous waste operations and emergency response standard. This analysis includes a profile of the industries that would be affected, the estimated number of employees who would be at risk from occupational exposures to hazardous wastes, technological feasibility, costs, benefits, and an overall economic impact of the proposed standard. The PRIA is available in the OSHA Docket Office.

Data Sources. The primary sources of information for this analysis are an April 1986 report by The Eastern Research Group (ERG) entitled, "Preparation of Data to Support A Regulatory Analysis and Environmental Assessment of the Proposed Standard for Working at Hazardous Waste Sites." Most of the information contained in this report was gathered from the Environmental Protection Agency sources, industry sources, experts in the area of hazardous waste management, etc. OSHA welcomes additional comments and all information supplied will be carefully reviewed and evaluated for incorporation into the Regulatory Impact Analysis (RIA) that will accompany the final rule.

Industry Profile. The proposed standard would affect about 20,000 uncontrolled hazardous waste sites. About 4,000 hazardous waste operations conducted under the Resource Conservation and Recovery Act (RCRA) of 1976, about 13,000 spills of hazardous materials that occur annually outside a fixed facility, and about 11,000 spills of hazardous materials that annually occur inside a fixed facility. The firms that would be affected by this proposed standard are as follows: about 100 contractors that perform hazardous waste cleanup; about 50 engineering or technical services firms that perform hazardous waste preliminary assessments or site investigations and remedial investigations or feasibility studies for hazardous waste site cleanups; about 300 RCRA-regulated commercial treatment, storage and disposal facilities; about 3,700 RCRA-regulated facilities that are operated by a hazardous waste generator; about 28,000 fire departments; about 750 private hazardous materials (HAZMAT) response teams; and about 22,000 manufacturers that use in-house personnel who respond to emergency spills of hazardous material within the facility.

Population at Risk. As many as 1,191,950 employees may be at risk from exposure to hazardous waste. Of these 1,191,950 employees, about 12,100 are employed at government-mandated uncontrolled hazardous waste site cleanups, about 52,700 are employed at RCRA-regulated facilities, about 944,500 are firefighters, about 7,500 are private HAZMAT members, and about 176,000 are members of industrial fire brigades that provide in-plant emergency responses to hazardous materials spills. Most of these employees, however, do not work full-time around hazardous waste. In fact, nearly all of the 1,120,500 firefighters and industrial fire brigade personnel who are at risk are annually exposed to hazardous materials for only a few hours. Virtually all of the public firefighters will be directly regulated by either individual state OSHA standards or the U.S. EPA standard.

Feasibility. The proposed standard does not require the use of any large-scale capital equipment that is not currently used in normal work operations. In addition, each proposed provision requires equipment and work practices that are currently available. Thus, OSHA has preliminarily determined that the proposed standard is technologically feasible.

Benefits. Numerous case studies indicate that exposures to hazardous waste cause adverse health consequences. Compliance with the proposed standard, therefore, would prevent employee fatalities and illnesses resulting from these acute and chronic exposures. OSHA has not quantified the expected reduction in the number of these occupational fatalities and illnesses because time was not sufficient to conduct field data collections on current and future exposures to hazardous waste. The probability that a significant number of excess fatalities and illnesses will occur in the absence of a proposed standard was clearly recognized by Congress in its mandate to OSHA to promulgate a standard within one year from the date that the Superfund Amendments and Reauthorization Act (SARA) became law. Compliance with the proposed standard will reduce the number of these fatalities and injuries by reducing
employee exposures to hazardous waste.

Cost of Compliance. OSHA has used current work practices as its baseline for estimating the cost of full compliance with the proposed standard. This estimated cost does not include any cost that is currently being incurred by employers as part of their work practices because those work practices, and therefore those costs, would continue whether or not the proposed standard were promulgated.

As seen in Table A, OSHA has estimated that the total annualized incremental cost of full compliance with the proposed standard would be about $148,472 million, of which $28,152 million would be spent by contractors on government-mandated uncontrolled hazardous waste site cleanups. $22,718 million would be spent by operators on RCRA-regulated facility cleanups and operations. $59,714 million would be spent by fire departments. $3,101 million would be spent by private HAZMAT teams, and $34,787 million would be spent by industrial fire brigades.

Although OSHA proposed standard does not directly cover state and local government employees. SARA requires that the U.S. EPA adopt the standard to cover state and local government employees in non-state plan states, and the OSHA Act requires that state plan states adopt comparable standard to cover state and local government employees. Thus, virtually all of the $59,714 million cost to fire departments will be directly mandated by either the individual states or the U.S. EPA.

The provision with the largest annual cost of compliance is the employee training provision ($71,482 million), followed by the medical surveillance provision ($16,611 million), the provision requiring the decontamination of personnel and equipment ($11,600 million), and the provision governing the use of totally encapsulating chemical protective (TECP) suits ($11,355 million).

The total cost of full compliance with the proposed standard is estimated at $148,472 million. This estimate includes the cost of training employees, which is estimated at $71,482 million. The cost of training employees is based on the assumption that all employees will need to be trained at least once per year. The cost of training employees is estimated to be $3,101 million per year.

As seen in Table A, OSHA has estimated that the total annualized incremental cost of full compliance with the proposed standard would be about $148,472 million, of which $28,152 million would be spent by contractors on government-mandated uncontrolled hazardous waste site cleanups. $22,718 million would be spent by operators on RCRA-regulated facility cleanups and operations. $59,714 million would be spent by fire departments. $3,101 million would be spent by private HAZMAT teams, and $34,787 million would be spent by industrial fire brigades.

Although OSHA proposed standard does not directly cover state and local government employees. SARA requires that the U.S. EPA adopt the standard to cover state and local government employees in non-state plan states, and the OSHA Act requires that state plan states adopt comparable standard to cover state and local government employees. Thus, virtually all of the $59,714 million cost to fire departments will be directly mandated by either the individual states or the U.S. EPA.

The provision with the largest annual cost of compliance is the employee training provision ($71,482 million), followed by the medical surveillance provision ($16,611 million), the provision requiring the decontamination of personnel and equipment ($11,600 million), and the provision governing the use of totally encapsulating chemical protective (TECP) suits ($11,355 million).

Economic Impacts. Most of the incremental cost of compliance will be paid by the government or the private firm responsible for the hazardous waste cleanup and OSHA has calculated that it is economically feasible for every affected industry or group to comply with the proposed standard.

OSHA has reviewed the interim final and proposed standards for hazardous waste operations and emergency response and has concluded that no significant environmental impacts are likely to result from the promulgation of these regulations. OSHA reserves the right to perform additional environmental analyses that may be appropriate as result of information and comments received in response to this Notice.

In OSHA's December 19, 1986, interim final rule for the protection of workers engaged in hazardous waste and emergency response operations, information was solicited from the public on various issues, including possible environmental impacts on the
regulation. To date, no comments have been received on the question of environmental impact. On the basis of the review detailed below, and in accordance with the requirements of the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321, et seq.), the Council on Environmental Quality (CEQ) NEPA regulations (40 CFR Part 1500, et seq.), and the Department of Labor. implementing regulations for NEPA compliance (29 CFR Part 11), the Assistant Secretary has determined that the proposed rule will not have significant impact on the external environment.

The preceding description of the proposed standard and its supporting rationale, together with the following discussion, constitute OSHA's environmental assessment and finding of no significant impact.

In most OSHA regulatory actions, two environments may be affected: (1) the workplace environment, and (2) the general human environment external to the workplace, including impacts on air and water pollution, solid waste, and energy and land use. The proposal for hazardous waste operations, however, is unique in that it focuses on the external environment because during these operations, the workplace and the external environment are usually one and the same. The proposed rule is also unusual in that it is the first regulation since the passage of the Occupational Safety and Health Act of 1970 (the Act) to be mandated specifically by Congress under Section 126 of the Superfund Amendments and Reauthorization Act of 1986 (SARA). As indicated in earlier general human environment external to workplace environment; and environmental assessment and finding rationale, together with the following environment.

As the interim final and proposed rules largely follow current operating practices, and the technology is available to implement the OSHA provisions, compliance is not anticipated to be difficulty. For example, section (c)(4)(iii) of the interim final rule proposes that if preliminary site evaluation cannot identify hazards or suspected hazards at the site. Level B ensemble of personal protective equipment shall be used and direct-reading instruments shall also be carried. OSHA analysis indicates that these procedures are already accepted industry practice.

Potential Positive Environmental Effects. While OSHA does not anticipate any significant environmental effects as a result of this proposal, there is potential for some beneficial impacts. In general, the work practices and procedures requirements of the proposal improve worker effectiveness and reduce the incidence of employee injury. Their indirect result should be to reduce the likelihood of environmental releases of hazardous materials.

(Virtually all provisions of the proposed standard can be categorized in this manner, because once they are implemented, they will have positive influence on worker safety and performance.) Because these requirements also provide guidance for routine reactions to situations encountered in emergencies, they may help to reduce the severity of such emergencies. Additional potentially positive impacts might be categorized as follows: (1) Direct benefits associated with reduced incidences in, or the severity of, the release of hazardous materials, and (2) Indirect benefits associated with the improved flow of information and increased worker awareness of hazardous materials or with improved worker preparedness (either for normal site operations or for unexpected accidents). The following discussion highlights those provisions with potentially beneficial environmental effects.

Paragraph (h)—Monitoring

The requirements of this provision will increase the amount of monitoring for airborne hazardous substances at uncontrolled hazardous waste sites. In some cases, hazardous materials will be detected, and steps will be taken to control the release to the atmosphere, thereby providing an environmental benefit.

Paragraph (i)—Handling Drums and Containers

A number of specific requirements of this paragraph will result in potentially positive environmental impacts. Relevant subsections include those for inspecting drums and containers; making salvage drums or absorbents available; initiating spill containment program; emptying unsound drums and containers; requiring ground penetrating radar; and decontamination procedures. These are discussed briefly in the following sections.

Inspection of drums/containers before moving [[i](i)(ii)]. This section would require that drums and containers be inspected for their integrity prior to handling and moving. Under current practices at hazardous waste clean-up sites, drums and containers are often handled with mechanized equipment (e.g., a barrel grapple on backhoe arm) before being inspected; if unsound drums rupture or leak, any soil contaminated by the rupture or leak is removed for disposal upon completion of drum handling operations. The proposed provision will, through worker awareness, increase the probability of averting ruptures and leakage. In addition, any hazardous materials in containers that cannot be moved without rupturing will have to be transferred to safe containers (as required in [[i](i)(vii)], with obvious positive environmental effect. These procedures should reduce the volume of contaminated soil requiring disposal; they should also lower the possibility that leachate or runoff will carry contaminants offsite. This requirement does not have an impact on emergency response actions because the routines outlined are already standard procedure.

Availability of salvage drums/absorbents [[i](i)(vii)]. This provision specifies that salvage drums or containers as well as suitable amounts of proper absorbent be kept available for use in areas where spills, leaks, or ruptures might occur. This requirement will result in increased availability of salvage drums and spill absorbents at uncontrolled hazardous waste sites and
in emergency response situations where spills are imminent, thereby reducing the environmental consequences related to spills of hazardous materials. In those instances where salvage drums/absorbsents would have been inadequate without this requirement, there is a potential benefit to the environment.

Implement a spill containment program \[(f)(1)(vii)]. The purpose of this provision is to develop a program to be implemented, in the event of a major spill, that would contain and isolate hazardous materials being transferred into containers and drums. To the extent that this program is implemented, there is a potential for reducing the negative environmental effects that occur as a result of spills, leakage, etc. This requirement should reduce the environmental impact of potential spills at clean-up sites.

Empty underground drums/containers \[(f)(1)(vii)]. Unsound containers often rupture during handling operations. This provision requires that drums and containers that cannot be moved without spillage, leakage, or rupture be emptied into a sound container. This requirement should reduce the incidence of drum and container rupture and would provide concomitant environmental benefits. Use of ground penetrating radar to estimate depth and location of containers \[(f)(1)(ix)]. At present, when preliminary investigations at hazardous waste sites indicate that buried drums or containers may be present, ground penetrating systems are frequently used to determine the depth and location of the drums. The requirements of this provision will very likely cause an increase in the use of these systems, thereby reducing the number of instances in which buried containers would go undetected or where undetected containers would be accidentally ruptured during excavation activities. Where it applies, the requirement will help prevent accidental ruptures and spills, improve the thoroughness of remedial actions, and benefit the site environment.

Develop decontamination procedures \[(i)(i)]. The requirement to clean and decontaminate equipment, personnel, and personal protective equipment will prevent the migration of hazardous substances out of the work zone, thereby benefitting the surrounding environment. It will also eliminate or minimize the contamination of personnel.

Decontamination is already a standard practice at most cleanup sites.

Inform Contractors of Existing Hazards \[(f)(15)] Under this provision, contractors are to be informed of any "fire, explosion, health or other safety hazards" that are present. By ensuring that contractors know the location and nature of site hazards, this requirement reduces the possibility that contractor activities will result in inadvertent releases or spills of hazardous materials.

Gather Information Before Site Entry \[(f)(3)]. Among the various requirements for site evaluation are those for information to be gathered regarding the (a) pathways for hazardous substance dispersion, and (b) status and capability of emergency response teams. These procedural requirements will result in an increased ability to predict and prevent movement of offsite hazardous materials, mitigate emergency situations quickly and effectively, and reduce the possibility or severity of contaminant release. Since the requirements of this section mirror current practices, compliance should be accomplished with little difficulty.

Provide worker training. \[(f)]. Training is required for all workers who are, or could be, exposed to hazardous substances, health hazardous, or safety hazards. In addition, all managers or supervisors responsible for employees at hazardous waste operations must receive preparatory training. This training assures that site activities will be carried out by qualified personnel, with the knowledge and ability to fulfill their job functions in a safe and responsible manner. To the extent that this occurs, there is a potential benefit to the environment (in emergency response situations, this training should assure a more efficient and effective cleanup of hazardous materials or a quicker response to avert further hazardous material releases).

Informal decontamination \[(i)(i)]. These provisions include requirements for a site safety and health plan, pre-entry briefings, and site inspections. The site plan provides information on key personnel, risk analyses for each site task and operation, employee training assignments, personal protective equipment, medical surveillance, frequency and types of air monitoring, environmental sampling techniques, site control measures, decontamination procedures, standard operating procedures, emergency response contingency plans, and entry procedures for confined spaces. These requirements will not directly affect the existing environment; their purpose is to provide workers with the information necessary to carry out their activities safely. To the extent that this occurs, there is a potential benefit to the environment. For example, implementing comprehensive site plans could reduce the incidence of accidental releases of hazardous materials.

Similarly, requiring pre-entry briefings will reduce the likelihood of employees unknowingly encountering contaminants or allowing their improper release or disposal.

Emergency response plan \[(f)(11)]. The development and implementation of a response plan for emergencies provide for greater worker preparedness. In emergencies, workers should be able to respond more quickly and effectively, thereby benefitting the environment.

Potentially negative impacts. Finally, it is necessary to consider the potential for adverse impacts to the environment that might occur as a result of the proposed standard. In some situations, there may be a potential for negative effects on the environment. Any potential negative impacts, however, are not expected to be significant. To illustrate, negative impacts may occur if there is an increase in the time required to implement specific cleanup and spill response activities, or to implement safe work practices or procedures required by the proposal. Any such effects are likely to be negligible, however. For example, CERCLA sites where site plans have not been developed there could be a potential negative impact as result of the time it might take to develop such a plan. In these cases, however, since site cleanup activities are carried out on a specific EPA timetable, it is not anticipated that OSHA requirements will alter these time frames. In fact, OSHA's intent was expressed clearly in the preamble to the interim final rule: "... It is not OSHA's intention that emergency actions necessary to protect the public safety and health be prevented because in a particular circumstance it is not feasible to carry out particular requirements of this standard in the time needed to respond to the emergency." In emergency response situations, therefore, OSHA work practices and procedures should not cause significant delays in response or slow the mitigation of environmental effects because, in most cases, response teams already have established operating procedures similar to those in OSHA's proposed rule.

Another potential negative impact may result from the requirement that salvage drums and absorbsents be readily available. This may increase the number of repacked hazardous waste drums and the amount of absorbent used, which could add to the amount of material that would require safe disposal. Similarly, the requirement for implementation of proper decontamination procedures for all equipment, personal protective gear, and personnel at hazardous waste
emergencies, cleanup sites, and RCRA sites may result in an increase in the frequency and use of decontamination materials. This, in turn, could generate a larger volume of spent decontamination fluids which would then require proper handling and disposal. Again, any such impact should be negligible since decontamination is largely standard procedure for most hazardous waste operations. A possible exception may be during activities that take place in the early stages of site evaluation before cleanup, or at spill responses, where decontamination procedures are not yet standardized.

Conclusion. To the extent that the proposed work practices and procedures are implemented, increased worker awareness and preparedness will result in a safer and more healthful work environment, which may indirectly benefit the environment. Any negative impacts that may occur as a result of the implementation of these work practices or procedures are expected to be negligible. Based upon this assessment and the information presented earlier in the preamble, OSHA concludes that no significant environmental changes are anticipated as a result of the proposal. OSHA will review any comments or information received in response to this Notice and reserves the right to perform additional environmental analysis, if necessary.

VI. International Trade

OSHA has evaluated the potential impact that this proposed standard would have upon international trade. OSHA has determined that the proposed standard would have a minimal potential impact upon the prices of products, so that there would be no effective change in the level of exported or imported products.

VII. Recordkeeping

The proposed standard contains "collection of information" (recordkeeping) requirements pertaining to preparation of a written safety and health plan, site characterization and analysis, site control, training, medical surveillance, emergency controls, work practices, PPE, monitoring, informational programs, handling drums and containers, decontamination, emergency response planning, and emergency response drills. In accordance with 5 CFR Part 1220 (Controlling Paperwork Burdens on the Public), OSHA has submitted the proposed recordkeeping requirements to the Office of Management and Budget (OMB) for review under section 3504(h) of the Paperwork Reduction Act. Comments regarding the proposed recordkeeping requirements may be directed to the Office of Information and Regulatory Affairs, OMB, Attention: Desk Officer of the Occupational Safety and Health Administration, Washington, DC 20503.

VIII. State Plan States

This Federal Register document proposes to amend an interim final rule § 1910.120, "Hazardous Waste Operations and Emergency Response") in Subpart H of 29 CFR Part 1910, OSHA's general industry standards on hazardous materials. The 25 States with their own OSHA approved occupational safety and health plans must develop a comparable standard applicable to both the private and public (State and local government employees) sectors. Within six months of the publication date of a permanent final rule or show OSHA why there is no need for action, e.g., because an existing state standard covering this area is already "at least as effective" as the new Federal standard. These states are Alaska, Arizona, California, Connecticut (for state and local government employees only), Hawaii, Indiana, Iowa, Kentucky, Maryland, Michigan, Minnesota, Nevada, New Mexico, New York (for state and local government employees only), North Carolina, Oregon, Puerto Rico, South Carolina, Tennessee, Utah, Vermont, Virginia, Virgin Islands, Washington, and Wyoming. After the effective date of a final Federal rule, until such time as a state standard is promulgated, Federal OSHA will provide interim enforcement assistance, as appropriate, in these states.

IX. Public Participation—Public Hearings

Interested persons are invited to submit written data, views, and arguments with respect to OSHA's proposed rule. These comments must be postmarked on or before October 5, 1987 and submitted in quadruplicate to the Docket Officer, Docket S-760A, Room N-3670, U.S. Department of Labor, Washington, DC 20210. Written submissions must clearly identify the specific provisions of the proposal which are addressed and the position taken with respect to each issue.

The data, views, and arguments that are submitted will be available for public inspection and copying at the above address. All timely submissions received will be made a part of the record of this proceeding. The preliminary regulatory impact assessment, regulatory flexibility assessment, and the exhibits cited in this document will be available for public inspection and copying at the above address. OSHA invites comment concerning the conclusions reached in the economic impact assessment.

OSHA recognizes that there may be interested persons who, through their knowledge of safety or their experience in the operations involved, would wish to endorse or support certain provisions of the standard. OSHA welcomes such supportive comments, including any pertinent accident data or cost information which may be available, in order that the record of this rulemaking will present a balanced picture of the public response on the issues involved.

Notice of Intention to Appear at the Informal Hearings

Pursuant to section 6(b)(3) of the OSHA Act, informal public hearings will be held on this proposal as follows (see the beginning of this notice for specific addresses):

October 13-16 and 20-23, 1987; Washington, DC
October 27-30, 1987; San Francisco, CA

Persons desiring to participate at the informal public hearing must file a notice of intention to appear by September 21, 1987. The notice of intention to appear must contain the following information:

1. The name, address, and telephone number of each person to appear;
2. The capacity in which the person will appear;
3. The city where the person intends to appear;
4. The approximate amount of time required for the presentation;
5. The specific issues that will be addressed;
6. A detailed statement of the position that will be taken with respect to each issue addressed; and
7. Whether the party intends to submit documentary evidence and, if so, a detailed summary of the evidence.

Filing of Testimony and Evidence Before the Hearing

Any party requesting more than ten (10) minutes for presentation at the informal public hearing, or who will submit documentary evidence, must provide in quadruplicate, the complete text of testimony including all documentary evidence to be presented at the informal public hearing. These materials must be provided to Mr. Thomas Hall, OSHA Division of Consumer Affairs at the address given in the "ADDRESSES" section of this notice by October 5, 1987.

Each submission will be reviewed in the light of the amount of time request in the Notice of Intention to Appear. In instances where the information contained in the submission does not
justify the amount of time requested, a more appropriate amount of time will be allocated and the participant will be notified of that fact prior to the informal public hearings.

Any party who has not substantially complied with the above requirement may be limited to a ten-minute presentation and may be requested to return for questioning at a later time.

Any party who has not filed a notice of intention to appear may be allowed to testify, as time permits, at the discretion of the Administrative Law Judge, but will not be allowed to question witnesses.

Signed at Washington, DC this 5th day of August 1987.

John A. Pendergrass,
Assistant Secretary of Labor.

For the reasons set out in the preamble, Title 29, Part 1910, of the Code of Federal Regulations is amended as follows:

PART 1910—OCCUPATIONAL SAFETY AND HEALTH STANDARDS

1. The authority citation for Subpart H of Part 1910 is proposed to be amended by adding the following citation:

Authority:

2. Section 1910.120 of Title 29 of the Code of Federal Regulations is proposed to be revised to read as follows:

§ 1910.120 Hazardous waste operations and emergency response.

(a) Scope, application, and definitions—(1) Scope for operations other than emergency response. This section covers employers and employees engaged in the following operations:

(i) Operations involving hazardous substances that are conducted under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 as amended (42 U.S.C. 9601 et seq.) (CERCLA), including initial investigations at CERCLA sites before the presence or absence of hazardous substances has been ascertained;

(ii) Clean-up operations involving major corrective actions conducted under the Resource Conservation and Recovery Act of 1976 as amended (42 U.S.C. 9601 et seq.) (RCRA);

(iii) Operations at hazardous waste sites that have been designated for clean-up by state or local governmental authorities; and

(iv) Storage, treatment, and disposal facilities involving hazardous wastes regulated under 40 CFR Parts 264 and 265 pursuant to RCRA; and

(2) Scope for emergency response operations. This section also covers employers whose employees have a reasonable possibility of engaging in emergency response operations for releases of, or substantial threats of releases of, hazardous substances without regard to the location of the hazard.

(3) Application. (i) All requirements of Part 1910 and Part 1026 of Title 29 of the Code of Federal Regulations apply pursuant to their terms to hazardous waste operations whether covered by this section or not. In addition, the provisions of this section apply to operations covered by this section. If there is a conflict or overlap, the provision more protective of employee safety and health shall apply without regard to 29 CFR 1910.120.

(ii) All paragraphs of this section except paragraph (o) apply to operations involving hazardous substances conducted under CERCLA, major corrective actions taken in clean-up operations under RCRA, and hazardous waste operations that have been designated for clean-up by state or local governmental authorities.

(iii) Only the requirements of paragraphs (l) and (o) of this section apply to those operations involving hazardous waste treatment, storage, and disposal facilities regulated under 40 CFR Parts 264 and 265.

Exceptions: For small quantity generators and generators with less than 90 days accumulation of hazardous wastes who have emergency response teams that respond to releases of, or substantial threats of releases of, hazardous substances, only paragraph (l) is applicable. Small quantity generators and generators with less than 90 days...
accumulation of hazardous wastes who do not have emergency response teams that respond to releases of, or substantial threats of releases of, hazardous substances are exempt from the regulations of this section.

(iv) Paragraph (l) of this section applies to all emergency response operations for releases of, or substantial threats of releases of, hazardous substances including those releases of or substantial threats of releases that occur at worksites other than those sites identified in paragraphs (a)(2)(i) through (a)(2)(iii) of this section.

(4) Definitions. "Buddy system" means a system of organizing employees into work groups in such a manner that each employee of the work group is designated to observe the activities of at least one other employee in the work group. The purpose of the buddy system is to provide rapid assistance to those other employees in the event of an emergency.

"Decommission" means the removal of hazardous substances from employees and their equipment to the extent necessary to preclude the occurrence of foreseeable adverse health affects.

"Emergency response" means a coordinated response effort by employees from outside the immediate release area or by outside responders (i.e., mutual-aid groups, local fire departments, etc.) to an occurrence which results, or is likely to result, in an uncontrolled release of a hazardous substance. Responses to incidental releases of hazardous substances where the substance can be absorbed, neutralized, or otherwise controlled at the time of release by employees in the immediate release area are not considered emergency responses within the scope of this standard. Responses to releases of hazardous substances where the concentration of a hazardous substance is below the established permissible exposure limits established in this standard are not considered to be emergency responses.

"Established exposure levels" means the inhalation or dermal permissible exposure limit specified in 29 CFR Part 1910. Subpart Z; or if none is specified, the exposure limits in "NIOSH Recommendations for Occupational Health Standards" dated 1986 incorporated by reference, or if neither of the above is specified, the standards specified by the American Conference of Governmental Industrial Hygienists in their publication "Threshold Limit Values and Biological Exposure Indices for 1980-87" dated 1986 incorporated by reference. The two documents incorporated by reference are available for purchase from the following:

NIOSH, Publications Dissemination, Division of Standards Development and Technology Transfer, National Institute for Occupational Safety and Health, 4670 Columbia Parkway, Cincinnati, OH 45226, (513) 841-4287

American Conference of Governmental Industrial Hygienists, 6500 Glenway Ave., Building D-7, Cincinnati, OH 45211-4438, (513) 661-7897

and are available for inspection and copying at the OSHA Docket Office, Docket No. S-760, Room N-3671, 200 Constitution Ave., N.W., Washington, DC 20210.

"Facility" means (A) any building, structure, installation, equipment, pipe or pipeline (including any pipe into a sewer or publicly owned treatment works), well, pit, pond, lagoon, impoundment, ditch, storage container, motor vehicle, rolling stock, or aircraft, or (B) any site or area where a hazardous substance has been deposited, stored, disposed of, or placed, or otherwise come to be located; but does not include any consumer product in consumer use or any vessel.

"Hazardous materials (HAZMAT) team" means an organized group of employees, designated by the employer, who are knowledgeable and specifically trained and skilled to handle and control leaking containers or vessels, use and select special chemical protective clothing and perform other duties associated with accidental releases of hazardous substances. The team members perform responses to releases of hazardous substances for the purpose of control or stabilization of the release. A HAZMAT team is not a fire brigade nor is a typical fire brigade a HAZMAT team. A HAZMAT team is not a fire department.

"Hazardous substance" means any substance designated or listed under (A) through (D) below, exposure to which results or may result in adverse affects on the health or safety of employees:

(A) Any substance defined under section 101(14) of CERCLA;
(B) Any biological agent and other disease-causing agent as defined in section 104(33) of CERCLA;
(C) Any substance listed by the U.S. Department of Transportation as hazardous materials under 49 CFR 172.101 and appendices; and
(D) Hazardous waste.

"Hazardous waste" means (A) a waste or combination of wastes as defined in 40 CFR 261.3, or (B) those substances defined in 49 CFR 171.8.

"Hazardous waste operation" means any operation conducted within the scope of this standard involving employee exposure to hazardous wastes, hazardous substances, or any combination of hazardous wastes and hazardous substances.

"Hazardous waste site" or "site" means any facility or location within the scope of this standard at which hazardous waste operations take place.

"Health hazard" means a chemical, mixture of chemicals or a pathogen for which there is statistically significant evidence based on at least one study conducted in accordance with established scientific principles that acute or chronic health effects may occur in exposed employees. The term "health hazard" includes chemicals which are carcinogenic, toxic or highly toxic agents, reproductive toxins, irritants, corrosives, sensitizers, hepatotoxins, nephrotoxins, neurotoxins, agents which act on the hematopoietic system, and agents which damage the lungs, skin, eyes, or mucous membranes. Further definition of the terms used above can be found in Appendix A to 29 CFR 1910.1200.

"IDLH" or "Immediately dangerous to life or health" means an atmospheric concentration of any toxic, corrosive or asphyxiant substance that poses an immediate threat to life or would cause irreversible or delayed adverse health effects or would interfere with an individual's ability to escape from a dangerous atmosphere.

"Oxygen deficiency" means that concentration of oxygen by volume below which air supplying respiratory protection must be provided. It exists in atmospheres where the percentage of oxygen by volume is less than 19.5 percent oxygen.

"Permissible exposure limit" means the inhalation or dermal permissible exposure limit specified in 29 CFR Part 1910, Subpart Z.

"Post emergency response" means that portion of an emergency response performed after the immediate threat of a release has been stabilized or eliminated and clean-up of the site has begun. If post emergency response is performed by an employer's own employees as a continuation of initial emergency response, it is considered to be part of the initial response and not post emergency response.

"Qualified person" means a person with specific training, knowledge and experience in the area for which the person has responsibility.

"Site safety and health supervisor (or official)" means the individual located on a hazardous waste site who is responsible to the employer and has the authority and knowledge necessary to implement the site safety and health...
and health program—(i) General

"Small quantity generator" means a generator of hazardous wastes who in any calendar month generates no more than 1000 kilograms (2210 pounds) of hazardous waste in that month.

(b) General requirements—(1) Safety and health program—(i) General. Employers shall develop and implement a written safety and health program for their employees involved in hazardous waste operations. The program shall be designed to identify, evaluate, and control safety and health hazards and provide for emergency response for hazardous waste operations. The program shall incorporate as separate chapter the following:

(A) Organizational structure chapter;
(B) A comprehensive workplan chapter; and
(C) A site-specific safety and health plan chapter.

(ii) Organizational structure chapter. (A) The organizational structure chapter shall establish the specific chain of command and specify the overall responsibilities of supervisors and employees. It shall include at a minimum, the following elements:

1. A general supervisor who has the responsibility and authority to direct all hazardous waste operations.
2. A safety and health supervisor who has the responsibility and authority to develop and implement the site safety and health plan and verify compliance.
3. All other personnel needed for hazardous waste site operations and emergency response and their general functions and responsibilities.
4. The lines of authority, responsibility, and communication.
(B) The organizational structure shall be reviewed and updated as necessary to reflect the current status of waste site operations.

(C) The original organizational structure plan and any changes to the overall organizational structure shall be made available to all affected employees.

(iii) Comprehensive workplan chapter. The comprehensive workplan chapter shall address the tasks and objectives of site operations and the logistics and resources required to reach those tasks and objectives.

(A) The comprehensive workplan shall address anticipated clean-up activities as well as normal operating procedures.

(B) The comprehensive workplan shall define work tasks and objectives and identify the methods for accomplishing those tasks and objectives.

(C) The comprehensive workplan shall establish personnel requirements for implementing the plan.

(D) The comprehensive workplan shall provide for the implementation of the training required in paragraph (e) of this section.

(E) The comprehensive workplan shall provide for the implementation of the required informational programs required in paragraph (i) of this section.

(F) The comprehensive workplan shall provide for the implementation of the medical surveillance program described in paragraph (f) of this section.

(iv) Site-specific safety and health plan chapter. The site safety and health plan, which is part of the overall safety and health program shall be available on the site for inspection by employees, their designated representatives, and OSHA personnel, shall address the safety and health hazards of each phase of site operation; and include the requirements and procedures for employee protection.

(A) The site safety and health plan, as a minimum, shall address the following:

1. Names of key personnel and alternates responsible for site safety and health, including a site safety and health supervisor.
2. A safety and health risk or hazard analysis for each site task and operation found in the workplan.
3. Employee training assignments to assure compliance with paragraph (e) of this section.
4. Personal protective equipment to be used by employees for each of the site tasks and operations being conducted as required by the personal protective equipment program in paragraph (g)(5) of this section.
5. Medical surveillance requirements in accordance with the program in paragraph (f) of this section.
6. Frequency and types of air monitoring, personnel monitoring, and environmental sampling techniques and instrumentation to be used including methods of maintenance and calibration of monitoring and sampling equipment to be used.
7. Site control measures in accordance with the site control program required in paragraph (d) of this section.
8. Decontamination procedures in accordance with paragraph (k) of this section.
9. An emergency response plan meeting the requirements of paragraphs (l)(1)(i) and (l)(1)(ii) of this section for safe and effective responses to emergencies, including the necessary PPE and other equipment.
10. Confined space entry procedures.

(B) Pre-entry briefings shall be held prior to initiating any site activity and at such other times as necessary to ensure that employees are apprised of the site safety and health plan and that this plan is being followed.

(C) Inspections shall be conducted by the site safety and health supervisor or, in the absence of that individual, another individual acting on behalf of the employer as necessary to determine the effectiveness of the site safety and health plan. Any deficiencies in the effectiveness of the site safety and health plan shall be corrected by the employer.

(1) When major spills may be anticipated due to volume of work involved, a spill containment program meeting the requirements of paragraph (l)(1) of this section shall be included.

(2) Site excavation. Site excavations created during initial site preparation or during hazardous waste operations shall be shored or sloped as appropriate to prevent accidental collapse in accordance with Subpart P of 29 CFR Part 1926.

(3) Contractors and sub-contractors. (i) An employer who retains contractor or sub-contractor services for work in hazardous waste operations shall inform those contractors, sub-contractors, or their representatives of any potential fire, explosion, health, safety or other hazards of the hazardous waste operation that have been identified by the employer including the employer's information program.

(ii) The safety and health program required in paragraph (b)(1) of this section shall be made available to any subcontractor or its representative who will be involved with the hazardous waste operation and employees, their designated representatives, and OSHA personnel.

(c) Site characterization and analysis. Hazardous waste sites shall be evaluated in accordance with this paragraph to identify specific site hazards and to determine the appropriate safety and health control procedures needed to protect employees from the identified hazards.

(1) A preliminary evaluation of a site's characteristics shall be performed prior to site entry by a qualified person in order to aid in the selection of appropriate employee protection methods prior to site entry. Immediately after initial site entry, a more detailed evaluation of the site's specific characteristics shall be performed by a qualified person in order to further identify existing site hazards and to further aid in the selection of the appropriate engineering controls and
personal protective equipment for the tasks to be performed.

(2) All suspected conditions that may pose inhalation or skin absorption hazards that are immediately dangerous to life or health (IDLH) or other conditions that may cause death or serious harm, shall be identified during the preliminary survey and evaluated during the detailed survey. Examples of such hazards include, but are not limited to, confined space entry, potentially explosive or flammable situations, visible vapor clouds, or areas where biological indicators such as dead animals or vegetation are located.

(3) The following information to the extent available shall be obtained by the employer prior to allowing employees to enter a site:

(i) Location and approximate size of the site.

(ii) Description of the response activity and/or the job task to be performed.

(iii) Duration of the planned employee activity.

(iv) Site topography.

(v) Site accessibility by air and roads.

(vi) Pathways for hazardous substance dispersion.

(vii) Present status and capabilities of emergency response teams that would provide assistance to hazardous waste clean-up site employees at the time of an emergency.

(viii) Hazardous substances and health hazards involved or expected at the site and their chemical and physical properties.

(4) Personal protective equipment (PPE) shall be provided and used during initial site entry in accordance with the following requirements:

(i) Based upon the results of the preliminary site evaluation, an ensemble of PPE shall be selected and used during initial site entry which will provide protection to a level of exposure below established permissible exposure limits for known or suspected hazardous substances and health hazards, and which will provide protection against other known and suspected hazards identified during the preliminary site evaluation.

(ii) During initial site entry an escape self-contained breathing apparatus of at least five minutes' duration shall be carried by employees or kept available at their immediate work station if positive-pressure self-contained breathing apparatus is not used as part of the entry ensemble.

(iii) If the preliminary site evaluation does not produce sufficient information to identify the hazards or suspected hazards of the site, an ensemble providing protection equivalent to Level B PPE shall be provided as minimum protection, and direct reading instruments shall be used as appropriate for identifying IDLH conditions. (See Appendix B for a description of Level B hazards and the requirements for Level B protective equipment.)

(iv) Once the hazards of the site have been identified, the appropriate PPE shall be selected and used in accordance with paragraph (g) of this section.

(5) The following monitoring shall be conducted during initial site entry when the site evaluation produces information that shows the potential for ionizing radiation or IDLH conditions, or when the site information is not sufficient to reasonably eliminate these possible conditions:

(i) Monitoring for hazardous levels of ionizing radiation.

(ii) Monitoring the air with appropriate test equipment for IDLH and other conditions that may cause death or serious harm (combustible or explosive atmospheres, oxygen deficiency, toxic substances).

(iii) Visually observing for signs of actual or potential IDLH or other dangerous conditions.

(6) Once the presence and concentrations of specific hazardous substances and health hazards have been established, the risks associated with these substances shall be identified. Employees who will be working on the site shall be informed of any risks that have been identified. In situations covered by the Hazard Communication Standard, 29 CFR 1910.1200, training required by that standard need not be duplicated.

Note.-Risks to consider include, but are not limited to:

a. Exposures exceeding the appropriate established Permissible Exposure Limits (PELs). Threshold Limit Values (TLVs), or Recommended Exposure Limits (RELs), etc.

b. IDLH Concentrations.

c. Potential Skin Absorption and Irritation Sources.

d. Potential Eye Irritation Sources.

e. Explosion Sensitivity and Flammability Ranges.

(7) Any information concerning the chemical, physical, and toxicologic properties of each substance known or expected to be present on site that is available to the employer and relevant to the duties an employee is expected to perform shall be made available to the affected employees prior to the commencement of their work activities.

(8) An ongoing air monitoring program in accordance with paragraph (b) of this section shall be implemented after site characterization has determined the site is safe for the start-up of operations.

(d) Site control. Appropriate site control procedures shall be implemented before clean-up work begins to control employee exposure to hazardous substances.

(1) A site control program for protecting employees which is part of the employer's safety and health program required in paragraph (b) of this section shall be developed during the planning stages of a hazardous waste operation clean-up and modified as necessary as new information becomes available.

(2) The site control program shall, as a minimum, include: A site map; site work zones; the use of a "buddy system"; site communications; the standard operating procedures or safe work practices; and, identification of the nearest medical assistance.

(e) Training. Initial or review training meeting the requirements of this paragraph shall be provided to employees before they are permitted to engage in hazardous waste operations that could expose them to hazardous substances, safety, or health hazards.

(1) All employees (such as but not limited to equipment operators and general laborers) exposed to hazardous substances, health hazards, or safety hazards shall be thoroughly trained in the following:

(i) Names of personnel and alternates responsible for site safety and health;

(ii) Safety, health and other hazards present on the site;

(iii) Use of personal protective equipment;

(iv) Work practices by which the employee can minimize risks from hazards;

(v) Safe use of engineering controls and equipment on the site;

(vi) Medical surveillance requirements including recognition of symptoms and signs which might indicate overexposure to hazards; and

(vii) The contents of paragraphs (7) through (10) of the site safety and health plan set forth in paragraph (b)(1)(iv)(A) of this section.

(2) All employees shall at the time of job assignment receive a minimum of 40 hours of initial instruction on the site, and a minimum of three days of actual field experience under the direct supervision of a trained, experienced supervisor. Workers who may be exposed to unique or special hazards shall be provided additional training. The level of training provided shall be consistent with the employee's job function and responsibilities.

(3) On-site management and supervisors directly responsible for, or who supervise employees engaged in.
hazardous waste operations shall receive training as provided in paragraph (e)(1) and (e)(2) of this section, and at least eight additional hours of specialized training at the time of job assignment on such topics as, but not limited to, the employer's safety and health program and the associated employee training program, personal protective equipment program, spill containment program, and health hazard monitoring techniques.

(4) Trainers shall be qualified to instruct employees about the subject matter that is being presented in training.

Note.—Trainers can show their qualifications by having the knowledge or training equivalent to a level of training higher than the level they are presenting. This may be shown by academic degrees, training courses completed and/or work experience.

(5) Employees shall not be permitted to participate in field activities until they have been trained to a level required by their job function and responsibility.

(6) Employees and supervisors that have received and successfully completed the training and field experience specified in paragraphs (e)(1), (e)(2) and (e)(3) of this section shall be certified by their instructor as having completed the necessary training. A written certificate shall be given to each person so certified. Any person who has not been so certified nor meets the requirements of paragraph (e)(9) of this section shall be prohibited from engaging in hazardous waste operations.

(7) Employees who are engaged in responding to hazardous emergency situations at hazardous waste clean-up sites that expose them to hazardous substances shall be trained in how to respond to expected emergencies.

(8) Employees specified in paragraph (e)(1), and managers and supervisors specified in paragraph (e)(3) of this section, shall receive eight hours of refresher training annually on the items specified in paragraph (e)(1) and/or (e)(3) of this section and other relevant topics.

(9) Employers who can show that an employee's work experience and/or training has resulted in initial training equivalent to that training required in paragraphs (e)(1), (e)(2), and (e)(3) of this section shall not be required to provide the initial training requirements of those paragraphs. Equivalent training includes the training that existing employees might have already received from actual site work experience.

(f) Medical surveillance. Medical surveillance shall be provided in accordance with this paragraph for employees exposed or potentially exposed to hazardous substances or health hazards or who wear respirators.

(1) Employees covered. A medical surveillance program which is part of the employer's safety and health program required in paragraph (b) of this section or required in paragraphs (i)(4) or (o)(3) of this section, shall be established by the employer for:

(i) All employees who are or may be exposed to hazardous substances or health hazards at or above the established exposure levels for these substances. Without regard to the use of respirators, for 30 days or more a year.

(ii) All employees who wear a respirator for 30 days or more a year or as required by § 1910.134.

(iii) All employees who are injured due to overexposure from an emergency incident involving hazardous substances or health hazards.

(2) Frequency of medical examinations and consultations. Medical examinations and consultations shall be made available by the employer to each employee covered under paragraph (f)(1) of this section on the following schedules:

(i) For employees covered under paragraphs (f)(1)(i) and (f)(1)(ii):

(A) Prior to assignment;

(B) At least once every twelve months for each employee covered;

(C) At termination of employment or reassignment to an area where the employee would not be covered if the employee has not had an examination within the last six months;

(D) As soon as possible following notification by an employee that the employee has developed symptoms indicating possible overexposure to hazardous substances or health hazards or that the employee has been exposed above the established exposure levels in an emergency situation;

(E) At more frequent times, if the examining physician determines that an increased frequency of examination is medically necessary.

(ii) For employees covered under paragraph (f)(1)(iii) and for all employees who may have been exposed during an emergency incident to hazardous substances at concentrations above the established exposure levels without the necessary personal protective equipment being used:

(A) As soon as possible following the emergency incident;

(B) Additional times, if the examining physician determines that follow-up examinations or consultations are medically necessary.

(3) Content of medical examinations and consultations. (i) Medical examinations required by paragraph (f)(2) of this section shall include a medical and work history (or updated history if one is in the employee's file) with special emphasis on symptoms related to the handling of hazardous substances and health hazards, and to fitness for duty including the ability to wear any required PPE under conditions (i.e., temperature extremes) that may be expected at the work site.

(ii) The content of medical examinations or consultations made available to employees pursuant to paragraph (f) shall be determined by the examining physician.

(4) Examination by a physician and costs. All medical examinations and procedures shall be performed by or under the supervision of a licensed physician, and shall be provided without cost to the employee, without loss of pay, and at a reasonable time and place.

(5) Information provided to the physician. The employer shall provide one copy of this standard and its appendices to the examining physician, and in addition the following for each employee:

(i) A description of the employee's duties as they relate to the employee's exposures;

(ii) The employee's exposure levels or anticipated exposure levels;

(iii) A description of any personal protective equipment used or to be used;

(iv) Information from previous medical examinations of the employee which is not readily available to the examining physician.

(v) Information required by § 1910.134.

(6) Physician's written opinion. (i) The employer shall obtain and furnish the employee with a copy of a written opinion from the examining physician containing the following:

(A) The results of the medical examination and tests if requested by the employee.

(B) The physician's opinion as to whether the employee has any detected medical conditions which would place the employee at increased risk of material impairment of the employee's health from work in hazardous waste operations or emergency response, or from respirators use as required by § 1910.134.

(C) The physician's recommended limitations upon the employee's assigned work.

(D) A statement that the employee has been informed by the physician of the results of the medical examination and any medical conditions which require further examination or treatment.
(ii) The written opinion obtained by the employer shall not reveal specific findings or diagnoses unrelated to occupational exposure.

(7) Recordkeeping. (i) An accurate record of the medical surveillance required by paragraph (f) of this section shall be retained. This record shall be retained for the period specified and meet the criteria of 29 CFR 1910.20.

(ii) The record required in paragraph (f)(7)(i) of this section shall include at least the following information:

(A) The name and social security number of the employee;

(B) Physicians' written opinions, recommended limitations, and results of examinations and tests;

(C) Any employee medical complaints related to exposure to hazardous substances;

(D) A copy of the information provided to the examining physician by the employer, with the exception of the standard and its appendices;

(g) Engineering controls, work practices, and personal protective equipment for employee protection. Engineering controls, work practices, personal protective equipment, or a combination of these shall be implemented in accordance with this paragraph to protect employees from exposure to hazardous substances and health hazards.

(1) Engineering controls, work practices and PPE for substances regulated in Subpart Z. (i) Engineering controls and work practices shall be instituted to reduce and maintain employee exposure to or below the permissible exposure limits for substances regulated by 29 CFR Part 1910, Subpart Z, except to the extent that such controls and practices are not feasible.

Note.—Engineering controls which may be feasible include the use of pressurized cabs or control booths on equipment, and/or the use of remotely operated material handling equipment. Work practices which may be feasible are removing all non-essential employees from potential exposure during opening of drums, wetting down dusty operations and locating employees upwind of possible hazards.

(ii) Whenever engineering controls and work practices are not feasible, PPE shall be used to reduce and maintain employee exposures to or below the permissible exposure limits or dose limits for substances regulated by 29 CFR Part 1910, Subpart Z.

(iii) The employer shall not implement a schedule of employee rotation as a means of compliance with permissible dose limits except when there is no other feasible way of complying with the airborne or dermal dose limits for ionizing radiation.

(ii) Engineering controls, work practices, and personal protective equipment for substances not regulated in Subpart Z. An appropriate combination of engineering controls, work practices, and personal protective equipment shall be established to reduce and maintain employee exposure to or below appropriate exposure levels for hazardous substances and health hazards not regulated by 29 CFR Part 1910, Subparts G and Z taking into account the established exposure levels.

(3) Personal protective equipment selection. (i) Personal protective equipment (PPE) shall be selected and used which will protect employees from the hazards and potential hazards they are likely to encounter as identified during the site characterization and analysis.

(ii) Personal protective equipment selection shall be based on an evaluation of the performance characteristics of the PPE relative to the requirements and limitations of the site, the task-specific conditions and duration, and the hazards and potential hazards identified at the site.

(iii) Positive pressure self-contained breathing apparatus, or positive pressure air-line respirators equipped with an escape air supply, shall be used in IDLH conditions.

(iv) Totally-encapsulating chemical protective suits (Protection equivalent to Level A protection as specified in Appendix B) shall be used in conditions where skin absorption of a hazardous substance may result in an IDLH condition or flammable atmospheres or oxygen-deficient atmospheres or other dangerous conditions such as the presence of flammable atmospheres or oxygen-deficient environments.

(v) The level of protection provided by PPE selection shall be increased when additional information on site conditions show that increased protection is necessary to reduce employee exposures below established permissible exposure limits for hazardous substances and health hazards. (See Appendix B for guidance on selecting PPE ensembles.)

Note.—The level of employee protection provided may be decreased when additional information or site conditions show that decreased protection will not result in increased hazardous exposures to employees.

(vi) Personal protective equipment shall be selected and used to meet the requirements of 29 CFR Part 1910, Subpart I, and additional requirements specified in this section.

(4) Totally-encapsulating chemical protective suits. (i) Totally-encapsulating suit materials used for Level A protection shall protect employees from the particular hazards which are identified during site characterization and analysis.

(ii) Totally-encapsulating suits shall be capable of maintaining positive air pressure. (See Appendix A.)

(iii) Totally-encapsulating suits shall be capable of preventing inward test gas leakage of more than 0.5 percent. (See Appendix A.)

(5) Personal protective equipment (PPE) program. A written personal protective equipment program, which is part of the employer's safety and health program required in paragraph (b) of this section or required in paragraph (1)(4) of this section, shall be established for hazardous waste operations which shall be part of the site-specific safety and health plan. The PPE program shall address the following elements:

(i) Site hazards,

(ii) PPE selection,

(iii) PPE use,

(iv) Work mission duration,

(v) PPE maintenance and storage,

(vi) PPE decontamination,

(vii) PPE training and proper fitting,

(viii) PPE donning and doffing procedures,

(ix) PPE inspection,

(x) PPE in-use monitoring.

(xi) Evaluation of the effectiveness of the PPE program,

(xii) Limitations during temperature extremes, and other appropriate medical considerations.

(h) Monitoring. Monitoring shall be performed in accordance with this paragraph to assure proper selection of engineering controls, work practices and personal protective equipment so that employees are not exposed to levels which exceed established permissible exposure limits for hazardous substances.

(1) Air monitoring shall be used to identify and quantify airborne levels of hazardous substances and health hazards in order to determine the appropriate level of employee protection needed on site.

(2) Upon initial entry, representative air monitoring shall be conducted to identify any IDLH condition, exposure over established exposure levels, exposure over a radioactive material's dose limits or other dangerous condition such as the presence of flammable atmospheres or oxygen-deficient environments.

(3) Periodic monitoring shall be conducted when the possibility of an IDLH condition or flammable atmosphere has developed or when there is indication that exposures may have risen since prior monitoring. Situations where it shall be considered...
whether the possibility that exposures have risen are when:

(i) Work begins on a different portion of the site.
(ii) Contaminants other than those previously identified are being handled.
(iii) A different type of operation is initiated (e.g., drum opening as opposed to exploratory well drilling).
(iv) Employees are handling leaking drums or containers or working in areas with obvious liquid contamination (e.g., a spill or lagoon).

(v) A sufficient reasonable interval has passed so that exposures may have significantly increased.

(4) After hazardous waste clean-up operations commence, the employer shall monitor those employees likely to have the highest exposures to hazardous substances and health hazards likely to be present above established permissible exposure limits by using personal sampling frequently enough to characterize employee exposures. The employer may utilize a representative sampling approach by documenting that the employees and chemicals chosen for monitoring are based on the criteria stated above.

Note.—It is not required to monitor employees engaged in site characterization operations covered by paragraph (c) of this section.

(i) Informational programs. Employers shall develop and implement a program, which is part of the employer's safety and health program required in paragraph (b) of this section, to inform employees, contractors, and subcontractors (or their representative) actually engaged in hazardous waste operations, of the nature, level and degree of exposure likely as a result of participation in such hazardous waste operations. Employees, contractors and subcontractors working outside of the operations part of a site are not covered by this standard.

(ii) Handling drums and containers. Hazardous substances and contaminated soils, liquids, and other residues shall be handled, transported, labeled, and disposed of in accordance with this paragraph.

(1) General. (i) Drums and containers used during the clean-up shall meet the appropriate DOT, OSHA, and EPA regulations for the wastes that they contain.

(ii) When practical, drums and containers shall be inspected and their integrity shall be assured prior to being moved. Drums or containers that cannot be inspected before being moved because of storage conditions (i.e., buried beneath the earth, stacked behind other drums, stacked several

esters high in a pile, etc.) shall be moved to an accessible location and inspected prior to further handling.

(iii) Unlabelled drums and containers shall be considered to contain hazardous substances and handled accordingly until the contents are positively identified and labeled.

(iv) Site operations shall be organized to minimize the amount of drum or container movement.

(v) Prior to movement of drums or containers, all employees exposed to the transfer operation shall be warned of the potential hazards associated with the contents of the drums or containers.

(vi) U.S. Department of Transportation specified salvage drums or containers and suitable quantities of proper absorbent shall be kept available and used in areas where spills, leaks, or ruptures may occur.

(vii) Where major spills occur, a spill containment program, which is part of the employer's safety and health program required in paragraph (b) of this section, shall be implemented to contain and isolate the entire volume of the hazardous substance being transferred.

(viii) Drums and containers that cannot be moved without rupture, leakage, or spillage shall be emptied into a sound container using a device classified for the material being transferred.

(ix) A ground-penetrating system or other type of detection system or device shall be used to estimate the location and depth of buried drums or containers.

(x) Soil or covering material shall be removed with caution to prevent drum or container rupture.

(xi) Fire extinguishing equipment meeting the requirements of 29 CFR Part 1910, Subpart L, shall be on hand and ready for use to control incipient fires.

(2) Opening drums and containers. The following procedures shall be followed in areas where drums or containers are being opened:

(i) Where an airline respirator system is used, connections to the bank of air cylinders shall be protected from contamination and the entire system shall be protected from physical damage.

(ii) Employees not actually involved in opening drums or containers shall be kept a safe distance from the drums or containers being opened.

(iii) If employees must work near or adjacent to drums or containers being opened, a suitable shield that does not interfere with the work operation shall be placed between the employee and the drums or containers being opened to protect the employee in case of accidental explosion.

(iv) Controls for drum or container opening equipment, monitoring equipment, and fire suppression equipment shall be located behind the explosion-resistant barrier.

(v) When there is a reasonable possibility of flammable atmospheres being present, material handling equipment and hand tools shall be of the type to prevent sources of ignition.

(vi) Drums and containers shall be opened in such a manner that excess interior pressure will be safely relieved. If pressure cannot be relieved from a remote location, appropriate shielding shall be placed between the employee and the drums or containers to reduce the risk of employee injury.

(vii) Employees shall not stand upon or work from drums or containers.

(3) Material handling equipment. Material handling equipment used to transfer drums and containers shall be selected, positioned and operated to minimize sources of ignition related to the equipment from igniting vapors released from ruptured drums or containers.

(4) Radioactive wastes. Drums and containers containing radioactive wastes shall not be handled until such time as their hazard to employees is properly assessed.

As a minimum, the following special precautions shall be taken when drums and containers containing or suspected of containing shock-sensitive wastes are handled:

(i) All non-essential employees shall be evacuated from the area of transfer.

(ii) Material handling equipment shall be provided with explosive containment devices or protective shields to protect equipment operators from exploding containers.

(iii) An employee alarm system capable of being perceived above surrounding light and noise conditions shall be used to signal the commencement and completion of explosive waste handling activities.

(iv) Continuous communications (i.e., portable radios, hand signals, telephones, as appropriate) shall be maintained between the employee-in-charge of the immediate handling area and the site safety and health supervisor or command post until such time as the handling operation is completed.

Communication equipment or methods
that could cause shock sensitive materials to explode shall not be used.

(v) Drums and containers under pressure, as evidenced by bulging or swelling, shall not be moved until such time as the cause for excess pressure is determined and appropriate containment procedures have been implemented to protect employees from explosive relief of the drum.

(vii) Drums and containers containing packaged laboratory wastes shall be considered to contain shock-sensitive or explosive materials until they have been characterized.

(6) Laboratory waste packs. In addition to the requirements of paragraph (j)(5) of this section, the following precautions shall be taken, as a minimum, in handling laboratory waste packs (lab packs):

(i) Lab packs shall be opened only when necessary and then only by an individual knowledgeable in the inspection, classification, and segregation of the containers within the pack according to the hazards of the wastes.

(ii) If crystalline material is noted on any container, the contents shall be handled as a shock-sensitive waste until the contents are identified.

(7) Sampling drums and containers. Sampling of containers and drums shall be done in accordance with a sampling procedure which is part of the site safety and health plan developed for and available to employees and others at the specific worksite.

(8) Shipping and transport. (i) Drums and containers shall be identified and classified prior to packaging for shipment.

(ii) Drum or container staging areas shall be kept to the minimum number necessary to identify and classify materials safely and prepare them for transport.

(iii) Staging areas shall be provided with adequate access and egress routes.

(iv) Bulking of hazardous wastes shall be permitted only after a thorough characterization of the materials has been completed.

(9) Tank and vault procedures. (i) Tanks and vaults containing hazardous substances shall be handled in a manner similar to that for drums and containers, taking into consideration the size of the tank or vault.

(ii) Appropriate tank or vault entry procedures meeting paragraph [b][1][iv][A][10] of this section shall be followed whenever employees must enter a tank or vault.

(k) Decontamination. Procedures for all phases of decontamination shall be developed and implemented in accordance with this paragraph.

(1) A decontamination procedure shall be developed, communicated to employees and implemented before any employees or equipment may enter areas on site where potential for exposure to hazardous substances exists.

(2) Standard operating procedures shall be developed to minimize employee contact with hazardous substances or with equipment that has contacted hazardous substances.

(3) Decontamination shall be performed in geographical areas that will minimize the exposure of uncontaminated employees or equipment to contaminated employees or equipment.

(4) All employees leaving a contaminated area shall be appropriately decontaminated; all clothing and equipment leaving a contaminated area shall be appropriately disposed of or decontaminated.

(5) Decontamination procedures shall be monitored by the site safety and health supervisor to determine their effectiveness. When such procedures are found to be ineffective, appropriate steps shall be taken to correct any deficiencies.

(6) All equipment and solvents used for decontamination shall be disinfected or disposed of properly.

(7) Protective clothing and equipment shall be decontaminated, cleaned, laundered, maintained, or replaced as needed to maintain their effectiveness.

(8) Employees whose non-impermeable clothing becomes wetted with hazardous substances shall immediately remove that clothing and proceed to shower. The clothing shall be disposed of or decontaminated before it is removed from the work zone.

(9) Unauthorized employees shall not remove protective clothing or equipment from change rooms.

(10) Commercial laundries or cleaning establishments that decontaminate protective clothing or equipment shall be informed of the potentially harmful effects of exposures to hazardous substances.

(11) Where the decontamination procedure indicates a need for regular showers and change rooms outside of a contaminated area, they shall be provided and meet the requirements of 29 CFR 1910.141. If temperature conditions prevent the effective use of water then other effective means for cleansing shall be provided and used.

(1) Emergency response. Emergency response at hazardous waste operation incidents shall be conducted in accordance with this paragraph.

(1) General—(i) Emergency response plan. An emergency response plan shall be developed and implemented by all employers within the scope of this section to handle anticipated emergencies prior to the commencement of hazardous waste operations. The plan shall be in writing and available for inspection and copying by employees, their representatives and OSHA personnel. Employers who will evacuate their employees from the workplace when an emergency occurs and who do not permit any of their employees to respond to assist in handling the emergency are exempt from the requirements of this paragraph if they provide an emergency action plan complying with section 1910.38(a) of this part.

(ii) Elements of an emergency response plan. The employer shall develop an emergency response plan for emergencies which shall address, as a minimum, the following:

(A) Pre-emergency planning.

(B) Personnel roles, lines of authority, training, and communication.

(C) Emergency recognition and prevention.

(D) Safe distances and places of refuge.

(E) Site security and control.

(F) Evacuation routes and procedures.

(G) Decontamination.

(H) Emergency medical treatment and first aid.

(I) Emergency alerting and response procedures.

(J) Critique of response and follow-up.

(K) PPE and emergency equipment.

(2) Emergency response at hazardous waste clean-up sites—(i) Training. (A) Training for emergency response employees at clean-up operations shall be conducted in accordance with paragraph (e) of this section for those employers covered by paragraph (a)(1)(i) through (iii) of this section and in accordance with paragraph (o)(5) of this section for those employers covered by paragraph (a)(1)(iv) of this section.

(B) Employers who can show that an employee's work experience and/or training has resulted in training equivalent to that training required in paragraph (1)(2)(i)(A) of this section shall not be required to provide the initial training requirements of those paragraphs. Equipment training includes the training that existing employees might have already received from actual site work experience.

(ii) Procedures for handling emergency incidents. (A) In addition to the elements for the emergency response plan required in paragraph (1)(1)(ii) of this section, the following elements shall
be included for emergency response plans:

(1) Site topography, layout, and prevailing weather conditions.
(2) Procedures for reporting incidents to local, state, and federal governmental agencies.

(B) The emergency response plan shall be a separate section of the Site Safety and Health Plan.

(C) The emergency response plan shall be compatible and integrated with the disaster, fire and/or emergency response plans of local, state, and federal agencies.

(D) The emergency response plan shall be rehearsed regularly as part of the overall training program for site operations.

(E) The site emergency response plan shall be reviewed periodically and, as necessary, be amended to keep it current with new or changing site conditions or information.

(F) An employee alarm system shall be installed in accordance with 29 CFR 1910.165 to notify employees of an emergency situation; to stop work activities if necessary; to lower background noise in order to speed communication; and to begin emergency procedures.

(G) Based upon the information available at time of the emergency, the employer shall evaluate the incident and the site response capabilities and proceed with the appropriate steps to implement the site emergency response plan.

3 Emergency response at sites other than hazardous waste clean-up sites—

(i) Training. Employers shall provide the training specified by this paragraph for those employees for whom there exists the reasonable possibility of responding to emergencies at sites other than hazardous waste clean-up sites.

(A) Emergency response organizations or teams. Employees on emergency response organizations or teams such as fire brigades, fire departments, plant emergency organizations, hazardous materials teams, spill response teams and similar groups with responsibility for emergency response shall be trained to a level of competence to protect themselves and other employees in the recognition of health and safety hazards, methods to minimize the risk from safety and health hazards, safe use of control equipment, selection and use of appropriate personal protective equipment, safe operating procedures to be used at the incident scene, techniques of coordination with other employees to minimize risks, appropriate response to over exposure from health hazards or injury to themselves and other employees and recognition of subsequent symptoms which may result from over exposures.

(B) Competency may be demonstrated by 24 hours of training annually in those areas with training sessions at least monthly or by demonstrations by the employee of competency in those areas at least quarterly.

(C) A certification shall be made of the training or competency and if certification of competency is made, the employer shall keep a record of the methodology used to demonstrate competency.

(D) An employer of employees for whom the reasonable possibility of responding to emergencies at other than hazardous waste clean-up sites exists need not train all such employees to the degree specified in paragraph (l)(3)(i)(A)(f) of this section if the employer divides the work force such that sufficient employees have responsibility to control the emergency, have the training specified in this paragraph and other employees who may first respond to the incident have sufficient awareness training to recognize that an emergency response situation exists and are instructed in that case to summon the employees who are fully trained and not attempt control activities for which they are not trained.

(E) An employer of employees for whom the reasonable possibility exists of responding to emergencies at other than hazardous waste clean-up sites need not train such employees to the degree specified in paragraph (l)(3)(i)(A)(f) of this section if paragraphs (l)(3)(i)(A)(f) however, receive at least 24 hours of training annually or demonstrate competency in that response that shall include instruction in the wearing of appropriate personal protective equipment, what chemical hazards are involved, and what duties are to be performed. All appropriate safety and health precautions provided to the employer's own employees shall be used to assure the safety and health of these personnel.

(ii) Procedures for handling emergency response. (A) The senior official responding to an emergency at other than hazardous waste clean-up sites involving a hazardous substance or health hazard shall establish and become the individual in charge of a site-specific Incident Command System (ICS). All emergency responders and their communications shall be coordinated and controlled through the individual in charge of the ICS assisted by the senior official present for each employer.

Note: The "senior official" at an off-site emergency response is the most senior official on the site who has the responsibility for controlling the operations at the site. Initially it is the senior officer on the first-due piece of responding emergency apparatus to arrive on the incident scene. As more senior officers arrive (i.e., fire chief, battalion chief, site coordinator, etc.) the position is passed up the line of authority.

(B) The individual in charge of the ICS shall identify, to the extent possible, all hazardous substances or conditions present and shall address as appropriate site analysis, use of engineering controls, maximum exposure limits, hazardous substance handling procedures, and use of any new technologies.

(C) Based on the hazardous substances and/or conditions present, the individual in charge of the ICS shall implement appropriate emergency response operations, and assure that the personal protective equipment worn is appropriate for the hazards to be encountered. However, personal protective equipment shall meet, at a minimum, the criteria contained in 29
CFR 1910.156(e) when worn while performing fire-fighting operations beyond the incipient stage. (D) Employees engaged in emergency response activities with hazardous substances shall wear positive pressure self-contained breathing apparatus while engaged in emergency response until such time that the individual in charge of the ICS determines through the use of air monitoring that a decreased level of respiratory protection will not result in hazardous exposures to employees. (E) The individual in charge of the ICS shall limit the number of emergency response personnel at the emergency site to those who are actively performing emergency operations. However, operations in hazardous areas shall be performed using the buddy system in groups of two or more. (F) Back-up personnel shall stand by with equipment ready to provide assistance or rescue. Qualified basic life support personnel, as a minimum, shall also stand by with medical equipment and transportation capability. (G) The individual in charge of the ICS shall designate a safety official, who is knowledgeable in the operations being implemented at the emergency response site, with specific responsibility to identify and evaluate hazards and to provide direction with respect to the safety of operations for the emergency at hand. (H) When activities are judged by the safety official to be an IDLH condition and/or to involve an imminent danger condition, the safety official shall have the authority to alter, suspend, or terminate those activities. The safety official shall immediately inform the individual in charge of the ICS of any actions taken to correct these hazards at an emergency scene. (I) After emergency operations have terminated, the individual in charge of the ICS shall implement appropriate decontamination procedures. (J) When deemed necessary for meeting the tasks at hand, approved self-contained compressed air breathing apparatus may be used with approved cylinders from other approved self-contained compressed air breathing apparatus provided that such cylinders are of the same capacity and pressure rating. All compressed air-cylinders used with self-contained breathing apparatus shall meet U.S. Department of Transportation and National Institute for Occupational Safety and Health criteria. (K) Hazardous materials teams (HAZMAT). (i) Employees who are members of a HAZMAT team shall be given training in accordance with paragraph (I) of this section that includes the care and use of chemical protective clothing, and procedures to be followed when working on leaking drums, containers, tanks, or bulk transport vehicles. (ii) Members of HAZMAT teams shall receive a base line physical exam and have medical surveillance as required in paragraph (I) of this section. (iii) Chemical personal protective clothing and equipment to be used by HAZMAT teams shall meet the requirements of paragraph (G) of this section. (L) Post-emergency response operations. Upon completion of the emergency response, if it is determined that it is necessary to remove hazardous substances, health hazards, and materials contaminated with them (such as contaminated soil or other elements of the natural environment) from the site of the incident the employer conducting the clean-up shall comply with one of the following: (i) Meet all of the requirements of paragraphs (b) through (n) of this section; or (ii) Where the clean-up is done on plant property using plant or workplace employees, such employees shall have completed the training requirements of the following: 29 CFR 1910.38(a); 1910.134; 1910.1200, and other appropriate safety and health training made necessary by the tasks that they are expected to be performed. All equipment to be used in the performance of the clean-up work shall be in serviceable condition and shall have been inspected prior to use. (m) Illumination. Areas accessible to employees shall be lighted in accordance with the requirements of this paragraph. (n) Sanitation at temporary workplaces. Facilities for employee sanitation shall be provided in accordance with this paragraph. (1) Potable water. (i) An adequate supply of portable water shall be provided on the site. (ii) Portable containers used to dispense drinking water shall be capable of being tightly closed, and equipped with a tap. Water shall not be dipped from containers. (iii) Any container used to distribute drinking water shall be clearly marked as to the nature of its contents and not used for any other purpose. (iv) Where single service cups (to be used but once) are supplied, both a sanitary container for the unused cups and a receptacle for disposing of the used cups shall be provided. (2) Nonpotable water. (i) Outlets for nonpotable water, such as water for firefighting purposes shall be identified to indicate clearly that the water is unsafe and is not to be used for drinking, washing, or cooking purposes. (ii) There shall be no cross-connection, open or potential, between a system furnishing potable water and a system furnishing nonpotable water. (3) Toilets facilities. (i) Toilets shall be provided for employees according to the following Table H-102.2.

### Table H-102.2—Toilet Facilities

<table>
<thead>
<tr>
<th>Number of employees</th>
<th>Minimum number of facilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 or fewer</td>
<td>One toilet seat and one sink per 20 employees.</td>
</tr>
<tr>
<td>More than 20, fewer than 200</td>
<td>One toilet seat and one sink per 40 employees.</td>
</tr>
<tr>
<td>More than 200</td>
<td>One toilet seat and one sink per 50 employees.</td>
</tr>
</tbody>
</table>

(ii) Under temporary field conditions, provisions shall be made to assure that at least one toilet facility is available. (iii) Hazardous waste sites not provided with a sanitary sewer shall be provided with the following toilet facilities unless prohibited by local codes: (A) Chemical toilets; (B) Recirculating toilets; (C) Combustion toilets; or (D) Flush toilets. (J) The requirements of this paragraph for sanitation facilities shall not apply to mobile crews having transportation readily available to nearby toilet facilities.
(v) Doors entering toilet facilities shall be provided with entrance locks controlled from inside the facility.

(4) Food handling. All food service facilities and operations for employees shall meet the applicable laws, ordinances, and regulations of the jurisdictions in which they are located.

(5) Temporary sleeping quarters. When temporary sleeping quarters are provided, they shall be heated, ventilated, and lighted.

(6) Washing facilities. The employer shall provide adequate washing facilities for employees engaged in operations where hazardous substances may be harmful to employees. Such facilities shall be in near proximity to the worksite; in areas where exposures are below established permissible exposure limits and which are under the controls of the employer; and shall be so equipped as to enable employees to remove hazardous substances for themselves.

(7) Showers and change rooms. When hazardous waste clean-up or removal operations commence on a site and the duration of the work will require six months or greater time to complete, the employer shall provide showers and change rooms for all employees exposed to hazardous substances and health hazards involved in hazardous waste clean-up or removal operations.

(i) Showers shall be provided and shall meet the requirements of 29 CFR 1910.141(d)(3).

(ii) Change rooms shall be provided and shall meet the requirements of 29 CFR 1910.141(1). Change rooms shall consist of two separate change areas separated by the shower area required in paragraph (n)(7)(i). One change area, with an exit leading off the worksite, shall provide employees with a clean area where they can remove, store, and put on street clothing. The second area, with an exit to the worksite, shall provide employees with an area where they can put on, remove and store work clothing and personal protective equipment.

(iii) Showers and change rooms shall be located in areas where exposures are below the established permissible exposure limits. If this cannot be accomplished, then a ventilation system shall be provided that will supply air that is below the established permissible exposure limits.

(iv) Employers shall assure that employees are shown at the end of their work shift and when leaving the hazardous waste site.

Employers conducting operations specified in paragraph (a)(2)(iii) of this section shall:

(1) Develop and implement a written safety and health program for employees involved in hazardous waste operations which shall be available for inspection by employees, their representatives and OSHA personnel.

The program shall be designed to identify, evaluate and control safety and health hazards in their facilities for the purpose of employee protection, and provide for emergency response meeting the requirements of paragraph (l) of this section and it shall address an appropriate site analysis, engineering controls, maximum exposure limits, hazardous waste handling procedures and uses of new technologies;

(2) Implement a hazard communication program as part of the employer's safety and health program meeting the requirements of 29 CFR 1910.1200.

Note.—The exemptions provided in § 1910.1200 are applicable to this section.

(3) Implement a medical surveillance program meeting the requirements of paragraph (f) of this section:

(4) Develop and implement a decontamination procedure in accordance with paragraph (k) of this section, and

(5) Develop and implement a training program, which is part of the employer's safety and health program, for employees involved in hazardous waste operations to enable each employee to perform their assigned duties and functions in a safe and healthful manner so as not to endanger themselves or other employees. The initial training shall be for 24 hours and refresher training shall be for eight hours annually.

(ii) Employers who can show by an employee's previous work experience and/or training that the employee has had training equivalent to the initial training required by this paragraph, shall be considered as meeting the initial training requirements of this paragraph as to that employee.

Equivalent training includes the training that existing employees might have already received from actual site work experience. Employees who have received the initial training required by this paragraph shall be given a written certificate attesting that they have successfully completed the necessary training.

(p) New technology programs. (1) The employer shall develop and implement procedures for the introduction of effective new technologies and equipment developed for the improved protection of employees working with hazardous waste clean-up operations, and the same shall be implemented as part of the site safety and health program to assure that employee protection is being maintained.

(2) New technology equipment or control measures available to the industry, such as the use of foams or other means to suppress the level of air contaminants while excavating the site or for spill control, shall be evaluated by employers or their representatives to determine their effectiveness before implementing their use on a large scale for employee protection. Such evaluations shall be made available to OSHA upon request.

Appendices to § 1910.120—Hazardous Waste Operations and Emergency Response

Note.—The following appendices serve as non-mandatory guidelines to assist employers and employees in complying with the appropriate requirements of this section.

However paragraph 1910.120(g) makes mandatory in certain circumstances the use of Level A and Level B PPE protection.

Appendix A—Personal Protective Equipment Test Methods

This appendix sets forth the non-mandatory examples of tests which may be used to evaluate compliance with paragraphs 1910.120(g)(iii) and (j). Other tests and other challenge agents may be used to evaluate compliance.

A. Totally-encapsulating chemical protective suit pressure test.

1.0—Scope.

1.1 This practice measures the ability of a gas tight totally-encapsulating chemical protective suit material, seams, and closures to maintain a fixed positive pressure. The results of this practice allow the gas tight integrity of a totally-encapsulating chemical protective suit to be evaluated.

1.2 Resistance of the suit materials to permeation, penetration, and degradation by specific hazardous substances is not determined by this test method.

2.0—Definition of terms.

2.1 “Totally-encapsulating chemical protective suit (TECP suit)” means a full body garment which is constructed of protective clothing materials; covers the wearer's torso, head, arms, and legs; may be insulated by material, and, in combination with the wearer's respiratory equipment, gloves, and boots; completely encloses the wearer's hands and feet with tightly attached gloves and boots; completely encloses the wearer by itself or in combination with the wearer's respiratory equipment, gloves, and boots.

2.2 “Protective clothing material” means any material or combination of materials used in an item of clothing for the purpose of isolating parts of the body from direct contact with a potentially hazardous liquid or gaseous chemicals.

2.3 “Gas tight” means, for the purpose of this test method, the limited flow of a gas under pressure from the inside of a TECP suit to atmosphere at a prescribed pressure and time interval.

3.0—Summary of test method.

3.1 The TECP suit is visually inspected and modified for the test. The test apparatus...
is attached to the suit to permit inflation to the pre-test suit expansion pressure for removal of suit wrinkles and creases. The pressure is lowered to the test pressure and monitored for three minutes. If the pressure drop is excessive, the TECF suit fails the test and is removed from service. The test is repeated after leak location and repair.

4.0—Required Supplies.

4.1 Source of compressed air.

4.2 Test apparatus for suit testing, including a pressure measurement device with a sensitivity of at least 1/4 inch water gauge.

4.3 Vent valve closure plugs or sealing tape.

4.4 Soapy water solution and soft brush.

4.5 Stop watch or appropriate timing device.

5.0—Safety Precautions.

5.1 Care shall be taken to provide the correct pressure safety devices required for the source of compressed air used.

6.0—Test Procedure.

6.1 Prior to each test, the tester shall perform a visual inspection of the suit. Check the suit for seam integrity by visually examining the seams and gently pulling on the seams. Make sure all air supply lines, fittings, visor, zippers, and valves are secure and show no signs of deterioration.

6.1.1 Seal off the vent valves along with any other normal inlet or exhaust points (such as umbilical air line fittings or face piece opening) with tape or other appropriate means (caps, plugs, fixture, etc.). Care should be exercised in the sealing process not to damage any of the suit components.

6.1.2 Close all closure assemblies.

6.1.3 Prepare the suit for inflation by providing an improvised connection point on the suit for connecting an airline. Attach the pressure test apparatus to the suit to permit suit inflation from a compressed air source equipped with a pressure indicating regulator.

6.1.4 The leak tightness of the pressure test apparatus should be tested before and after each test by closing off the end of the tubing attached to the suit and assuring a pressure of three inches water gauge for three minutes. The test may be made without the use of a stop watch or other appropriate time device.

6.1.5 Inflate the suit until the pressure inside is equal to pressure "A"; the pre-test expansion suit pressure. Allow at least one minute to fill out the wrinkles in the suit. Release sufficient air to reduce the suit pressure to pressure "B", the test suit test pressure. Begin timing. At the end of three minutes, record the suit pressure as pressure "C" the ending suit pressure. The difference between the suit test pressure and the ending suit test pressure (B-C) shall be defined as the suit pressure drop.

6.1.6 If the suit pressure drop is more than 20 percent of the suit test pressure B during the three-minute test period, the suit fails the test and shall be removed from service.

7.0—Report Procedure.

7.1 If the suit fails the test check for leaks by inflating the suit to pressure A with compression air and brushing or wiping the entire suit (including seams, closures, lens gaskets, glove-to-sleeve joints, etc.) with a mild soap and water solution. Observe the suit for the formation of soap bubbles, which is an indication of a leak. Repair any identified leaks.

7.2 Re-test the TECF suit as outlined in Test procedure 6.0.

8.0—Summary of recommended practice.

8.1 The volume of concentrated aqueous ammonia solution (ammonia hydroxide NH₄OH) required to generate the test atmosphere is determined using the directions outlined in 6.1. The suit is donned by a person wearing the appropriate respiratory equipment (either a self-contained breathing apparatus or a supplied air respirator) and worn inside the enclosed test room. The concentrated aqueous ammonia solution is taken by the suited individual into the test room and poured into an open plastic pan. A two-minute evaporation period is observed before the test room concentration is measured, using a high range ammonia length of stain detector tube. When the ammonia vapor reaches a concentration of between 1000 and 1200 ppm, the suited individual starts a standardized exercise protocol to stress and flex the suit. After this protocol is completed, the test room concentration is measured again. The suited individual leaves the test room and his stand-by person measures the ammonia concentration inside the suit using a low range ammonia length of stain detector tube or other more sensitive ammonia detector. A stand-by person is required to observe the test individual during the test procedure; aid the person in donning and doffing the TECF suit; and monitor the suit interior. The intrusion coefficient of the suit is determined by dividing the average test area concentration by the interior suit concentration. A colorimetric indicator strip of bromophenol blue is placed on the inside of the suit face piece lens so that the suited individual is able to detect a color change and know if the suit has a significant leak. If a color change is observed the individual shall leave the test room immediately.

9.0—Required supplies.

9.1 A supply of concentrated aqueous ammonia (58 percent ammonium hydroxide by weight).

9.2 A supply of bromophenol blue indicating paper, sensitive to 5—10 ppm ammonia or greater over a two-minute period of exposure. [pH 3.0 (yellow) to pH 4.6 (blue)]

9.3 A supply of high range (0.5—10 volume percent) and low range (5—700 ppm) detector tubes for ammonia and the corresponding sampling pump. More sensitive ammonia
detectors can be substituted for the low range detector tubes to improve the sensitivity of this practice.

4.4 A shallow plastic pan (PVC) at least 12"\(\times\)14"\(\times\)1" and a half pint plastic container (PVC) with tightly closing lid.

4.5 A graduated cylinder or other volumetric measuring device of at least 50 milliliters in volume with an accuracy of at least ±1 milliliters.

5.0 — Safety precautions.

5.1 Concentrated aqueous ammonium hydroxide, NZ\(\text{OH}\), is a corrosive volatile liquid requiring eye, skin, and respiratory protection. The person conducting the test shall review the MSDS for aqueous ammonia.

5.2 Since the established permissible exposure limit for ammonia is 50 ppm, only persons wearing a self-contained breathing apparatus or a supplied air respirator shall be in the chamber. Normally only the person wearing the total-encapsulating suit will be inside the chamber. A stand-by person shall have a self-contained breathing apparatus, or a supplied air respirator available to enter the test area should the suited individual need assistance.

5.3 A method to monitor the suited individual must be used during this test. Visual contact is the simplest but other methods using communication devices are acceptable.

5.4 The test room shall be large enough to allow the exercise protocol to be carried out and then to be ventilated to allow for easy exhaust of the ammonia test atmosphere after the test(s) are completed.

5.5 Individuals shall be medically screened for the use of respiratory protection and checked for allergies to ammonia before participating in this test procedure.

6.0 — Test procedure.

6.1.1 Measure the test area to the nearest foot and calculate its volume in cubic feet. Multiply the test area volume by 0.2 milliliters of concentrated aqueous ammonia solution per cubic foot of test area volume to determine the approximate volume of concentrated aqueous ammonia required to generate 1000 ppm in the test area.

6.1.2 Measure this volume from the supply of concentrated aqueous ammonia and place it into a closed plastic container.

6.1.3 Place the container, several high range ammonia detector tubes, and the pump in the clean test pan and locate it near the test area entry door so that the suited individual has easy access to these supplies.

6.2 In a non-contaminated atmosphere, open a pre-sealed ammonia indicator strip and fasten one end of the strip to the inside of the suit face shield lens where it can be seen by the wearer. Moisten the indicator strip with distilled water. Care shall be taken not to contaminate the detector part of the indicator paper by touching it. A small piece of masking tape or equivalent should be used to attach the indicator strip to the interior of the suit face shield.

6.2.2 If problems are encountered with this method of attachment, the indicator strip can be attached to the outside of the respirator face piece being used during the test.

6.3 Don the respiratory protective device normally used with the suit, and then don the TECP suit to be tested. Check to be sure all openings which are intended to be sealed (zippers, gloves, etc.) are completely sealed. DO NOT, however, plug off any venting valves.

6.4 Step into the enclosed test room such as a closet, bathroom, or test booth, equipped with an exhaust fan. No air should be exhausted from the chamber during the test because this will dilute the ammonia challenge concentrations.

6.5 Open the container with the pre-measured volume of concentrated aqueous ammonia within the enclosed test room, and pour the liquid into the empty plastic test pan. Wait two minutes to allow for adequate volatilization of the concentrated aqueous ammonia. A small mixing fan can be used near the evaporation pan to increase the evaporation rate of the ammonia solution.

6.6 After two minutes a determination of the ammonia concentration within the chamber should be made using the high range colorimetric detector tube. A concentration of 1000 ppm ammonia or greater shall be generated before the exercises are started.

6.7 To test the integrity of the suit the following four minute exercise protocol should be followed:

a. Bending the arms above the head with at least 15 raising motions completed in one minute.

b. Walking in place for one minute with at least 15 raising motions of each leg in a one-minute period.

c. Touching the toes with at least 10 complete standing and squating motions in a one-minute period.

6.8 If at any time during the test the colorimetric indicating paper should change colors, the test should be stopped and sections 6.10 and 6.12 initiated (See § 4.2).

6.9 After completion of the test exercise, the test area concentration should be measured again using the high range colorimetric detector tube.

6.10 Exit the test area.

6.11 The area created by the suit zipper or other appropriate suit penetration should be used to determine the ammonia concentration in the suit with the low range length of stain detector tube or other ammonia monitor. The internal TECP suit air should be sampled far enough from the enclosed test area to prevent a false ammonia reading.

6.12 After completion of the measurement of the suit interior ammonia concentration the test is concluded and the suit is doffed and the respirator removed.

6.13 The ventilating fan for the test room should be turned on and allowed to run for enough time to remove the ammonia gas. The fan shall be vented to the outside of the building.

6.14 Any detectable ammonia in the suit interior (five ppm ammonia [NIh] or more for the length of stain detector tube) indicates that a suit has failed the test. When other ammonia detectors are used a lower level of detection is possible, and it should be specified as the pass/fail criteria.

6.15 By following this test method, an intrusion coefficient of approximately 200 or more can be measured with the suit in a completely operational condition.

7.0 — Retest procedures.

7.1 If the suit fails this test, check for leaks by following the pressure test in test A above.

7.2 Retest the TECP suit as outlined in the test procedure 6.0.

8.0 — Report.

8.1 Each gas tight totally-encapsulating chemical protective suit tested by this practice shall have the following information recorded.

8.1.1 Unique identification number, identifying brand name, date of purchase, material of construction, and unique suit features; e.g., special breathing apparatus.

8.1.2 General description of test room used for test.

8.1.3 Brand name and purchase date of ammonia detector strips and color change data.

8.1.4 Brand name, sampling range, and expiration date of the length of stain ammonia detector tubes. The brand name and model of the sampling pump should also be recorded. If another type of ammonia detector is used, it should be identified along with its minimum detection limit for ammonia.

8.1.5 Actual test results shall list the two test area concentrations, their average, the interior suit concentration, and the calculated intrusion coefficient. Retest data shall be recorded as an additional test.

8.2 The evaluation of the data shall be specified as "suit passed" or "suit failed" and the date of the test. Any detectable ammonia (five ppm or greater for the length of stain detector tube) in the suit interior indicates the suit has failed this test. When other ammonia detectors are used, a lower level of detection is possible and it should be specified as the pass/fail criteria.

Caution

Visually inspect all parts of the suit to be sure they are positioned correctly and secured tightly before putting the suit back into service. Special care should be taken to examine each exhaust valve to make sure it is not blocked.

Care should also be exercised to assure that the inside and outside of the suit is completely dry before it is put into storage.

Appendix B — General Description and Discussion of the Levels of Protection and Protective Gear

This appendix sets forth information about personal protective equipment (PPE) protection levels which may be used to assist employers in complying with the PPE requirements of this section. As required by the standard, PPE must be selected which will protect employees from the specific hazards which they are likely to encounter during their work on-site.

Selection of the appropriate PPE is a complex process which must take into consideration a variety of factors. Key factors involved in this process are identification of the hazards, or suspected hazards; their routes of potential hazard to employees.
(inhalation, skin absorption, ingestion, and eye or skin contact); and the performance of the PPE materials (and seams) in providing a barrier to these hazards. The amount of protection provided by PPE is material/hazard specific. That is, protective equipment materials will protect well against some hazardous substances and poorly, or not at all, against others. In many instances, protective equipment materials cannot be found which will provide continuous protection from the particular hazardous substance. In these cases the breakthrough time of the protective material should exceed the work durations, or the exposure after breakthrough must not pose a hazardous level.

Other factors in this selection process to be considered are matching the PPE to the employee’s work requirements and task-specific conditions. The durability of PPE materials, such as tear strength and seam strength, must be considered in relation to the employee’s tasks. The effects of PPE in relation to heat stress and task duration are a factor in selecting and using PPE. In some cases layers of PPE may be necessary to provide sufficient protection, or to protect expensive PPE inner garments, suits or equipment.

The more that is known about the hazards at the site, the easier the job of PPE selection becomes. As more information about the hazards and conditions at the site becomes available, the site supervisor can make decisions to up-grade or down-grade the level of PPE protection to match the tasks at hand. The following are guidelines which an employer can use to begin the selection of the appropriate PPE. As noted above, the site information may suggest the use of combinations of PPE selected from the different protection levels (i.e., A, B, C, or D) as being more suitable to the hazards of the work. It should be cautioned that the listing below does not fully address the performance of the specific PPE material in relation to the specific hazards at the job site, and that PPE selection, evaluation and re-selection is an ongoing process until sufficient information about the hazards and PPE performance is obtained.

Part A. Personal protective equipment is divided into four categories based on the degree of protection afforded. (See Part B of this appendix for further explanation of Levels A, B, C, and D hazards.)

1. Level A—To be selected when the greatest level of skin, respiratory, and eye protection is required.

   a. Head protection. *
   b. Eye protection.
   c. Face protection.
   d. Respiratory protection.
   e. Bodysuits.
   f. Chemically resistant gloves or clothing.
   g. Chemical resistant boots.
   h. Safety shoes or boots.
   i. Safety equipment.
   j. Hard hat.
   k. Hoods.
   l. Chemical protective gowns or suits.
   m. Chemical protective overalls.

2. Level B—To be used when a lesser level of protection is necessary but a lesser level of skin protection is needed.

   a. Head protection. *
   b. Eye protection.
   c. Face protection.
   d. Respiratory protection.
   e. Bodysuits.
   f. Chemically resistant gloves or clothing.
   g. Chemical resistant boots.
   h. Safety shoes or boots.
   i. Safety equipment.
   j. Hard hat.
   k. Chemical resistant clothing or suits.
   l. Chemical protective overalls.
   m. Heavy duty protective clothing.

3. Level C—To be used when the hazardous substance has been identified and requires a higher level of protection for skin, eyes, and the respiratory system based on either the measured (or potential for) high concentration of atmospheric vapors, gases, or particulates; or the site operations and work functions involve a high potential for splash, immersion, or exposure to unexpected vapors, gases, or particulates of materials that are harmful to skin or capable of being absorbed through the intact skin.

   a. Head protection. *
   b. Eye protection.
   c. Face protection.
   d. Respiratory protection.
   e. Bodysuits.
   f. Chemically resistant gloves or clothing.
   g. Chemical resistant boots.
   h. Safety shoes or boots.
   i. Safety equipment.
   j. Hard hat.
   k. Chemical resistant clothing or suits.
   l. Chemical protective overalls.
   m. Heavy duty protective clothing.

4. Level D—To be used when the hazardous substance has been identified and requires a high level of protection for skin, eyes, and the respiratory system based on either the measured (or potential for) high concentration of atmospheric vapors, gases, or particulates; or the site operations and work functions involve a high potential for splash, immersion, or exposure to unexpected vapors, gases, or particulates of materials that are harmful to skin or capable of being absorbed through the intact skin.

   a. Head protection.
   b. Eye protection.
   c. Face protection.
   d. Respiratory protection.
   e. Bodysuits.
   f. Chemically resistant gloves or clothing.
   g. Chemical resistant boots.
   h. Safety shoes or boots.
   i. Safety equipment.
   j. Hard hat.
   k. Chemical resistant clothing or suits.
   l. Chemical protective overalls.
   m. Heavy duty protective clothing.

Part B. The types of hazards for which levels A, B, C, and D protection are appropriate are described below:

1. Level A—Level A protection should be used when:
   a. The hazardous substance has been identified and requires the highest level of protection for skin, eyes, and the respiratory system based on either the measured (or potential for) high concentration of atmospheric vapors, gases, or particulates; or the site operations and work functions involve a high potential for splash, immersion, or exposure to unexpected vapors, gases, or particulates of materials that are harmful to skin or capable of being absorbed through the intact skin.
   b. Substances with a high degree of hazard to the skin are known or suspected to be present, and skin contact is possible; or
   c. Operations must be conducted in a confined, poorly ventilated areas, and the absence of conditions requiring Level A has not yet been determined.

2. Level B protection should be used when:
   a. The type and atmospheric concentration of substances have been identified and require a high level of respiratory protection, but less skin protection.

   Note.—This involves atmospheres with IDLH concentrations of specific substances that do not represent a severe skin hazard; or that do not meet the criteria for use of air-purifying respirators.
   b. The atmosphere contains less than 19.5 percent oxygen; or
   c. The presence of incompletely identified vapors or gases is indicated by a direct-reading organic vapor detection instrument, but vapors and gases are not suspected of containing high levels of chemicals harmful to skin or capable of being absorbed through the intact skin.

3. Level C protection should be used when:
   a. The atmospheric contaminants, liquid splashes, or other direct contact will not adversely affect or be absorbed through any exposed skin.
   b. The types of air contaminants have been identified, concentrations measured, and an air-purifying respirator is available that can remove the contaminants; and
   c. All criteria for the use of air-purifying respirators are met.

4. Level D protection should be used when:
   a. The atmosphere contains no known hazard; and
   b. Work functions preclude splashes, immersion, or the potential for unexpected inhalation of or contact with hazardous levels of any chemicals.

Note.—As stated before, combinations of personal protective equipment other than those described for Levels A, B, C, and D protection may be more appropriate and may be used to provide the proper level of protection.

Appendix C—Compliance Guidelines

1. Occupational Safety and Health Program. Each hazardous waste site clean-up effort will require an occupational safety and health program decided by the site

   a. Head protection.
   b. Eye protection.
   c. Face protection.
   d. Respiratory protection.
   e. Bodysuits.
   f. Chemically resistant gloves or clothing.
   g. Chemical resistant boots.
   h. Safety shoes or boots.
   i. Safety equipment.
   j. Hard hat.
   k. Chemical resistant clothing or suits.
   l. Chemical protective overalls.
   m. Heavy duty protective clothing.
The program will be designed for the protection of employees at the site. The purpose of the program will need to be developed before work begins on the site and implemented as work proceeds. The program is to facilitate coordination and communication among personnel responsible for the various activities which will take place at the site. It will provide the overall means for identifying and controlling orientation of employees who will be working at the site. The program will provide the means for identifying and controlling worksite hazards and the means for monitoring program effectiveness. The program will need to cover the responsibilities and authority of the site coordinator or the employer's manager on the site for the safety and health of employees at the site, and the relationships with contractors or support services as to what each employer's safety and health responsibilities are for their employees at the site. Each contractor on the site needs to have its own safety and health program so structured that it will smoothly interface with the program of the site coordinator.

Also those employees involved with treating, storing, or disposal of hazardous waste as covered in paragraph (o) must have implemented a safety and health plan for their employees. This program is to include the hazard communication program required in paragraph (i)(1) and the training required in paragraph (i)(2) as part of the employer's comprehensive overall safety and health program. This program is to be in writing.

Each site or workplace safety and health program will need to include the following: (1) Policy statements of the line of authority and accountability for implementing the program, the objectives of the program and the role of the site safety and health supervisor or manager and staff; (2) means or methods for the development and communication to employees of the various plans, work rules, standard operating procedures and practices that pertain to employees and supervisors; (3) means for the training of supervisors and employees to develop the needed skills and knowledge to perform their work in a safe and healthy manner; (5) means to anticipate and prepare for emergency situations and; (6) means for obtaining information feedback to aid in evaluating the program and for improving the effectiveness of the program. The management and employees should be trying continually to improve the effectiveness of the program thereby enhancing the protection being afforded those working on the site.

Accidents on the site or workplace should be investigated to provide information on how such occurrences can be avoided in the future. When injuries or illnesses occur on the site or workplace, they will need to be investigated to determine what needs to be done to prevent this incident from occurring again. Such need to be used as feedback on the effectiveness of the program and the information turned into positive steps to prevent any reoccurrence. Receipt of employee suggestions or complaints relating to safety and health issues involved in workplace activities is also a feedback mechanism that can be used effectively to improve the program and may serve in part as an evaluative tool(s).

2. Training. The employer is encouraged to utilize those training programs that have been recognized by the National Institute of Environmental Health Sciences through its training grants program. These training and educational programs are being developed for employees who work directly with hazardous substances. For further information about these programs contact: National Institute of Environmental Health Sciences, P.O. Box 12233, Research Triangle Park, NC 27709.

The training programs for employees subject to the requirements of paragraph (e) of this standard are expected to address: the safety and health hazards employees should expect to face; control measures or techniques are effective for those hazards; what monitoring procedures are effective in characterizing exposure levels; what makes an effective employee's safety and health program; what a site safety and health plan should include; and employee's responsibilities under OSHA and other regulations. Supervisors will need training in their responsibilities under the safety and health program and its subject areas such as the spill containment program, the personal protective equipment program, the medical surveillance program, the emergency response plan and other areas.

Training programs for emergency service organizations are available from the U.S. National Fire Academy, Emmitsburg, MD and the various state fire training schools. The International Society of Fire Service Instructors, Ashland, MA is another resource.

The training programs for employees covered by requirements of paragraph (f)(3) of this standard are expected to address: the need for and use of personal protective equipment including respirators; the decontamination procedures to be used; preplanning activities for hazardous substances involving the emergency response plan; company standard operating procedures for hazardous substance emergency responses; the use of the incident command system and other subjects. Hands-on training should be stressed whenever possible. Critiques done after an incident which include any evaluation of what worked and what did not and how we can do better the next time may be counted as training time.

For hazardous materials teams, the training will need to address the care, use and/or testing of chemical protective clothing including totally encapsulating suits, the medical surveillance program, the standard operating procedures for the use of plugging andpatching equipment and other subject areas.

Officers and leaders who may be expected to be in charge at an incident will need to be fully knowledgeable of their company's incident command system. They will need to know where and how to obtain additional assistance and be familiar with the local district's emergency response plan. Technical experts or medical experts or environmental experts that work with hazardous materials in their regular tasks, who may be called to the incident scene by the shipper, manufacturer or governmental agency to advise and assist the person in charge of the incident need not have monthly training sessions, however, they will be required to have the 24 hours of training on an annual basis. Their training must include the care and use of personal protective equipment including respirators: knowledge of the incident command system; and those areas needed to keep them current in their respective field as it relates to safety and health involving specific hazardous substances.

Those employees who work for public works departments or special equipment operators who operate bulldozers, sand trucks, backhoes, etc., who may be called to the incident scene to provide emergency support assistance, will need at least a safety and health briefing before entering the area of potential or actual exposure. These specially skilled persons, who have not been a part of the emergency plan and do not meet the required training hours, must be made aware of the hazards they face and be provided all necessary protective clothing and equipment required for their tasks. If respirators are to be worn, the specially skilled person shall be trained in accordance with §1910.134 before proceeding into the hazardous area to do their assigned job.

3. Decontamination. Decontamination procedures should be tailored to the specific hazards of the site, and will vary in complexity and number of steps. depending on the level of hazard and the employee's exposure to the hazard. Decontamination procedures and PPE decontamination methods will vary depending on the specific substance, since one procedure or method will not work for all substances. Evaluation of decontamination methods and procedures should be performed, as necessary, to assure that employees are not exposed to hazards by re-using PPE. References in Appendix D may be used for guidance in establishing an effective decontamination program.

4. Emergency response plans. States, along with designated districts within the states, will be developing or have developed emergency response plans. These state and district plans are to be utilized in the emergency response plans called for in this standard. Each employer needs to assure that its emergency response plan is compatible with the local plan. In addition, the Chemical Manufacturers' Association (CMA) is another helpful resource in formulating an effective emergency response plan. Also the current Emergency Response Guidebook from the U.S. Department of Transportation, CMA's CHEMTREC and the Fire Service Emergency Management Handbook should be used as resources.
